

Individual Research Project (40 to 60 credits)

All MEng Engineering students in their fourth year engage in a significant individual project. Those students registered on energy engineering programmes will be encouraged to choose research topics that relate to energy. Combined with the team-based project in third year this will mean that in the final stage of the degrees students will study 160 to 180 of their 240 credits on energy-related topics.

Materials Science students complete a 60 credit industrially-based project in the first half of their fourth year.
