14:00	Optional University Site Tour

NISP Network Resource Matching workshops are lively and interactive events facilitated by our experienced team of industrial symbiosis practitioners. The workshops maximise networking opportunities with other companies from a range of sectors. The workshop is structured to record the resource streams generated or used by participating companies and to identify mutually beneficial (profitable) transactions.

Industrial symbiosis through this facilitated process has an excellent track record of generating significant cost savings and identifying new markets whilst reducing both CO₂ and waste.

Companies attending the workshop have the option to purchase a comprehensive bespoke report with full details of the matches identified.

Additional workshop packages are available by subscribing to the NISP Network which gives a range of further benefits including a dedicated Members' website. The website has the functionality to upload resources directly into a comprehensive database for analysis and matching. There is also an extensive case study archive including innovative examples of resource recovery and re-use. Each NISP Network member has a designated practitioner to help identify the most profitable business opportunities for your company.

The workshop will take place on **Thursday 24th January 2013**
