

Musculoskeletal & Neurological Rehabilitation

Research Group Lead: Cath Sackley

The rehabilitation research group carries out a range of research revolving around the theme of rehabilitation.

The group consists of allied health professionals and researchers from a variety of scientific backgrounds, with a common interest in health services research. They investigate the problems experienced by individuals with neurological, cardiovascular and musculoskeletal disabilities who are living in the community.

Current projects involve various research methods ranging from randomised clinical trials methodology to data analyses using large primary care databases. There is a particular focus on the problems experienced by older adults and the team works closely with service users to identify their most pressing problems.
