About

Anna Peacock was appointed as a Lecturer in the School of Chemistry in 2009.

Anna's research interests lie in the field of bioinorganic chemistry and *de novo* peptide design. In particular, research is directed towards the development of novel metallopeptides with potential therapeutic applications.

Qualifications

Lecturer in Chemistry:

- PhD in Chemistry, University of Edinburgh, 2007
- MChem (Hons) in Chemistry, University of York, 2003

Biography

Anna Peacock qualified with a MChem (Hons) in Chemistry from the University of York in 2003. She performed her dissertation with Professor Robin N. Perutz and Dr Anne-Kathrin Duhme-Klair on the development of a metal-based lumophore tailored to sense biologically relevant oxometalates. She then went on to study for a PhD with Professor Peter J. Sadler FRS at the University of Edinburgh on the design of osmium(II) arene anticancer complexes. This work resulted in a patent application being filed by the University of Edinburgh.

In 2007 Anna moved to a post-doctoral position at the University of Michigan with Professor Vincent L Pecoraro to work on the *de novo* design of metallopeptides. In 2009 Anna took up her first academic post as a Lecturer in the School of Chemistry here at the University of Birmingham

Teaching

Teaching Programmes

Anna is involved in various teaching activities in the School of Chemistry. Current lecture courses include Supramolecular Chemistry, and Bioinorganic & Coordination Chemistry.

Postgraduate supervision

Anna is interested in supervising doctoral research students in the following areas:

- *De novo* design of lanthanide peptide coiled coils
- DNA binding peptide sensors

If you are interesting in studying any of these subject areas please contact Anna on the contact details above, or for any general doctoral research enquiries, please email: dr@contacts.bham.ac.uk (mailto:dr@contacts.bham.ac.uk) or call +44 (0)121 414 5005.

For a full list of available Doctoral Research opportunities, please visit our **[Doctoral Research programme listings. \(http://www.bham.findaphd.com/?es=y&apl=y&aplt=&show\)](http://www.bham.findaphd.com/?es=y&apl=y&aplt=&show)**.

Research

RESEARCH THEMES

De novo peptide design, DNA binding metallopeptides, gadolinium coiled coils

RESEARCH ACTIVITY

Design of peptide architectures for DNA binding

Our group is interested in the design of peptide sequences which fold into well-defined structures capable of both selective DNA recognition and binding. This is achieved by utilising the α -helix as the DNA major groove recognition domain. We are interested in the design of metal sites which are able to preorganise the α -helices so as to enhance DNA binding, and which are capable of providing a measurable output with potential sensor applications.

Development of gadolinium coiled coil complexes

A second project within the group involves the design, synthesis and evaluation of gadolinium coiled coil complexes as potentially novel MRI contrast agents. By correlating peptide design, solution studies and computational modelling with MR data, we aim to understand the mechanism by which we produce contrast and develop a new class of gadolinium complexes with enhanced relaxivity.

Other activities

- Member of COST D39 "Metallo-Drug Design and Action"
- Associate faculty member of Faculty of 1000 Biology
- Member of the Royal Society of Chemistry
