UK

### About

Jonathan Eden's research primarily focuses on the effect of climate change on regional-scale precipitation. He has a particular expertise in developing statistical downscaling techniques for precipitation simulated in climate models. Jonathan currently works on the international research project PLEIADES, which aims to develop a statistical correction method for simulated precipitation, with a specific focus on extreme events.

### Qualifications

- Ph.D Climate Science, University of Birmingham
- MSc Applied Meteorology and Climatology, University of Birmingham
- BSc (Hons) Geography, University of Birmingham

### Biography

Jonathan completed his Ph.D here at Birmingham in 2011. His thesis focused on the development of a downscaling correction approach for future precipitation changes simulated by global climate models. Upon finishing his Ph.D, Jonathan accepted a position as a Research Fellow on a NERC-funded project investigating climate reconstruction and predictability in Ethiopia.

In October 2011, Jonathan began work on the PLEIADES project funded by the Volkswagen Foundation. Much of the work undertaken during his Ph.D thesis contributed towards the successful grant application for PLEIADES and Jonathan is currently furthering some of the downscaling methods he has developed over the last few years.

### Teaching

Jonathan teaches on the following modules of the **[Applied Meteorology and Climatology MSc](http://www.birmingham.ac.uk/postgraduate/courses/taught/gees/applied-met-climatology.aspx)** (<http://www.birmingham.ac.uk/postgraduate/courses/taught/gees/applied-met-climatology.aspx>).

- Weather Forecasting and Climate Modelling (M2)
- Atmospheric Data Processing and Statistics (M3)

Jonathan also co-supervises a number of MSc dissertation students.

### Research

#### Research groups

- **[Climate and atmosphere](http://www.birmingham.ac.uk/research/activity/environmental-health/themes/climate/index.aspx)** (<http://www.birmingham.ac.uk/research/activity/environmental-health/themes/climate/index.aspx>)
- **[Geosystems](http://www.birmingham.ac.uk/research/activity/geosystems/index.aspx)** (<http://www.birmingham.ac.uk/research/activity/geosystems/index.aspx>)

#### Research Interests

- Global climate modelling
- Past and future climate change
- Statistical downscaling for precipitation
- Precipitation extremes

#### Current / Recent Research

##### PLEIADES: Statistical downscaling for precipitation extremes

Extreme precipitation events constitute major natural hazards. Reliable estimates of precipitation changes are required at local scales where impacts are most keenly felt. However, the limited spatial resolution and the systematic errors of precipitation simulated in General Circulation Models (GCMs) make direct estimates of future daily precipitation from GCMs unrealistic. As part of the international research project PLEIADES (funded by the Volkswagen Foundation) we aim to develop a correction approach based on Model Output Statistics (MOS) to downscale GCM-simulated daily precipitation distributions. Skilful downscaling models will be applied to GCM simulations for the 21<sup>st</sup> century in order to produce more meaningful projections of local- and regional-scale precipitation, including extreme events.

*Collaborators:* **[Dr Martin Widmann](http://www.birmingham.ac.uk/schools/gees/people/profile.aspx?Referenceld=10968&Name=dr-martin-widmann)** (<http://www.birmingham.ac.uk/schools/gees/people/profile.aspx?Referenceld=10968&Name=dr-martin-widmann>), *Dr Douglas Maraun* (GEOMAR, Kiel), *Dr Mathieu Vrac* (LSCE-IPSL, Gif-sur-Yvette).

Understanding the skill of methods used to downscale future scenarios is a crucial component of climate change science. However, many aspects of downscaling methods, including the representation of extreme events and spatial coherence, have not been systematically validated. The COST Action **VALUE** (<http://www.value-cost.eu>) (2011-2015) provides a research network across Europe and facilitates the interaction of various research communities with stakeholders. Over the course of four years, VALUE will deliver an assessment of end-user needs, a benchmark dataset and a comprehensive validation of a suite of downscaling methods. Jonathan is a member Working Group 4, which specifically aims to review, validate and improve methods to downscale extremes.

### Validation of GCM-simulated precipitation

The reliability of General Circulation Model (GCM) projections of future precipitation is usually based simply on the degree of consensus amongst multiple GCMs. More meaningful projections should ideally consider the errors and biases associated with each GCM. We conduct 'nudged' simulations of the ECHAM5 GCM on the University of Birmingham's BlueBEAR Linux cluster in which the circulation and temperature fields are forced towards corresponding quasi-observations. In forcing the large-scale climatic state into temporal phase with the observed record, it is possible to compare the sequence of events in observed and simulated precipitation, and thus identify regions where performance in representing temporal variability is strong.

*Collaborators:* **Dr Martin Widmann** (<http://www.birmingham.ac.uk/schools/gees/people/profile.aspx?Referenceld=10968&Name=dr-martin-widmann>), Dr Sebastian Rast (Max Planck Institute for Meteorology, Hamburg), David Grawe (University of Hamburg).

### Other activities

- Member of Working Group 4 (Extremes) within the European research network **VALUE** (<http://www.value-cost.eu>) (EU COST Action ES1102).
- Reviewer for a number of scientific journals, including International Journal of Climatology, Climatic Change and Journal of Geophysical Research - Atmospheres.
- Member of the European Geosciences Union.
- Member of the British Hydrological Society.
- Associate Fellow of the Royal Meteorological Society.

### Awards

- Ph.D School Studentship (2007-2010)
- MSc NERC Studentship (half award) (2004-05)
