University of Birmingham
Edgbaston
Birmingham
B15 2TT
UK

About

Dr Nick Kettridge specializes in characterizing the ecohydrological resilience of ecosystems to both natural and anthropogenic disturbance. Much of his research focuses on peatlands; understanding the processes that control the provision of key ecosystem services within these environments, and quantifying their response to changing climatic conditions and extreme events such as fire and drought.

Qualifications

2005 – PhD Geography – University of Sheffield

2002 – BSC Geography – University of Sheffield

Biography

- Lecturer in Water Sciences, University of Birmingham (2012-)
- Post doctoral research fellow, McMaster University (2010-2011)
- Post doctoral research fellow, Lancaster University (2006-2010)
- PhD. 'The thermal behavior of northern peatlands', University of Sheffield (2002-2005)
- BSC (Hons) in Geography, University of Sheffield (1999-2002)

Teaching

Undergraduate Modules:

- Earth and Ecological Systems (Module convener; Year 1, GGM102)
- Global Environmental Issues (Year 1, GGM103)
- Snowdonia Field Course and Tutorials (Year 1, GGM105)
- Research Methods for Dissertations (Year 2, GGM201)
- Geography and Geography/Geology dissertation supervision (Year 3, GGM301)
- Wetland Environments (Module convener; Year 3, GGM308)

Masters Modules:

- Environmental Analysis and Modelling (GGM506)
- Advances in Water Sciences
- Project/dissertation supervision

Postgraduate supervision

- **Rhoswen Leonard** (2013-present) The ecohydrological functioning of the Canadian Western Boreal Plain and its response to wildfire
- **Isaac Aidoo** (2013-present) Suspended Sediment Dynamics/Turbidity during storm events in an Urban River Catchment: River Tame
- **Michael Grocott** (2012-present) The hydrology of biological hotspots in a glacierized catchment: an integrated tracing and modeling study

Research

The resilience of ecosystems to both natural and anthropogenic disturbance is controlled by a complex array of interconnected feedback mechanisms that transcend the traditional disciplines of ecology, hydrology, terrestrial and aquatic biogeochemistry and micro-meteorology and propagate across both spatial and temporal scales. Nick's research breaks down these boundaries and investigates the essential system interactions that control the response of ecosystems to changing environmental pressures.

From left to right: a) Männikjärve Bog, Estonia, b) GPR measurements at

Caribou Bog, Maine, USA, c) automated evaporation chamber measurements, Dinner bog, Ontario, Canada, d) Sphagnum desiccation, Cors Fochno, Wales, d) methane ebullition from a harvested poor fen, Quebec, Canada.

Much of Nick's research focuses on peatlands; understanding the processes that control the provision of key ecosystem services within these environments, and quantifying their response to changing climatic conditions and extreme events such as fire and drought. Peatlands are an essential hydrological resource and an important carbon store and climate regulator, containing approximately 10% of the global liquid surface fresh water supply and representing one third of the global soil carbon pool. Managing the competing demands of water security and carbon mitigation within these sensitive ecosystems, whilst preserving their unique biodiversity, is one of the key challenges facing current environmental policies. Nick's research investigates the interconnected feedback mechanisms that control the response of these ecosystem services to key pressures, working at spatial scales ranging from individual biogenic gas bubbles to the continental scale, at timescales ranging from hours to millennia. This research brings together field scale monitoring, field and laboratory manipulations and computer simulations to unravel these complex interactions, providing a process-based understanding of ecosystem function. Only through this improved process understanding can we predict future ecohydrological and biogeochemical responses of these environments to changing climatic conditions, characterize the resilience of current ecosystem services and develop informed, relevant management and restoration strategies.

Left, Burnt Crow, a bog within central Alberta, Canada, burnt during a wildfire in 2006. Right, Salteaux, a fen drained within the 1980's and subsequently burnt in 2003, also within central Alberta.
