Birmingham  
B15 2TT  
UK

### About

Dr Beierholm is a computational neuroscientist researching issues on theoretical models of information processing at the behavioural level, i.e. how perceptual stimuli and cognitive instructions lead to human decisions and actions.

Dr. Beierholm is part of the [Centre for Computational Neuroscience and Cognitive Robotics \(CNCR\)](http://www.birmingham.ac.uk/research/activity/cncr/index.aspx) (<http://www.birmingham.ac.uk/research/activity/cncr/index.aspx>)

Personal website: <https://sites.google.com/site/beierh/> (<https://sites.google.com/site/beierh/>)

### Qualifications

- B.Sc. (Physics, University of Copenhagen, 1999)
- M.Sc. (Physics, University of Copenhagen, 2001)
- PhD (Computation and Neural Systems, Caltech, 2007)

### Biography

Dr Ulrik Beierholm studied physics at University of Copenhagen before deciding on a research career in Neuroscience. From 2001 to 2007 he was a PhD student at the California Institute of Technology (Caltech) in the Computation and Neural Systems program, being rewarded a Fulbright fellowship. After his studies he completed further post-doctoral training at the Gatsby Computational Neuroscience Unit (at UCL) in London where he worked with Professor Peter Dayan on modelling learning and decision making while on a Marie Curie Reintegration grant.

### Teaching

- Introduction to Learning
- Introduction to Computational Methods (MSc)
- Advanced Computational Methods (MSc)
- Minds, Brains and Models (MSc)

### Postgraduate supervision

New students are always welcome to enquire via email about potential research positions/placements. See also [Dr Beierholm's FindAPhD page](http://www.findaphd.com/search/ProjectDetails.aspx?PJID=34647&LID=148) (<http://www.findaphd.com/search/ProjectDetails.aspx?PJID=34647&LID=148>).

### Research

Statistical learning models provide a powerful framework for analyzing and modeling human behavior and decision making. Dr Beierholm's research focuses on developing such models to understand human choices in perception, cognition and learning, and on testing them through psychophysics and fMRI.

Examples of research questions include:

- How do we learn based on rewards and punishment in our environment?
- What role does prior expectations about the structure of our environment play in our perception of it?
- How do we process uncertainty in e.g. a gambling task or in a spatial reaching task?
- How do different learning and control systems (e.g. habitual and cognitive) interact in human behavior and how are they presented in the brain?

### Other activities

Member of British Neuroscience Association, Society for Neuroscience and Society for Neuroeconomics.

Editor of the Bayesian section of the Springer 'Encyclopedia of Computational Neuroscience'
