About

Dr Martin Widmann is a climate scientist. His current main research area is regional climate change, in particular the development and validation of statistical downscaling methods. He also studies past climates; the main activity in this field is the development of data assimilation methods to combine climate simulations with empirical knowledge from proxy data.

Biography

- Dipl. Phys., University of Freiburg, 1992
- Ph.D., Institute for Atmospheric Science, ETH Zuerich, 1996
- Postdoc, Department of Atmospheric Sciences, University of Washington, Seattle, 1996-1999
- Scientist, Institute for Coastal Research, GKSS Research Centre, Geesthacht, 1999-2006
- Guest lecturer at University of Lueneburg, 2000-2003
- Lecturer, GEES, University of Birmingham, 2006 - 2011
- Senior Lecturer, GEES, University of Birmingham, 2011-present

Postgraduate supervision

PhD students (main supervisor)

- 2012 – present: **Anastasios Matsikaris**, 'Palaeo data assimilation with a GCM using an ensemble-based method'.
- **Jonathan Eden**, 2007-2011. Estimation of regional precipitation from GCM simulations using model output statistics. School funded
- **Kerstin Prömmel**, 2004-2008. Regional climate simulations over the Alps. GKSS Research Centre, Geesthacht, Germany, with Julie Jones. Funded by EU Framework
- **Nikolaus Groll**, 2003-2006. Sensitivity of teleconnections and interscale relationships to orbital forcing, GKSS Research Centre, Geesthacht, Germany, with Julie Jones. Funded by German climate research program DEKLIM, as well as by the Helmholtz Society, Germany

Research

Research groups

- Climate & Atmosphere
- Geosystems

Research interests

- climate modelling
- past and future climate change
- data assimilation in palaeoclimatology
- statistical downscaling for precipitation

Current / recent research

Transient GCM simulations of the mid-Holocene climate and comparison with palaeoclimate proxy data

Together with Sebastian Wagner (GKSS Research Centre, Geesthacht, Germany) and Julie Jones (University of Sheffield) I am investigating the climate response to orbital and solar forcing using transient simulations for the mid-Holocene (7.0-4.5 ka BP) with a coupled atmosphere-ocean general circulation model (project MIDHOL). In collaboration with colleagues from the universities of Bremen and Cologne we have also performed consistency tests between the statistically downscaled simulations and climate proxy data from North and South America. MIDHOL has been funded by the German climate research programme DEKLIM.

Southern Hemisphere atmospheric circulation

I work with Julie Jones (University of Sheffield) on reconstructions of the state of the Southern Hemisphere Annular Mode (the major mode of extratropical atmospheric

circulation in the Southern Hemisphere, also known as the Antarctic Oscillation) from the twentieth century, and from tree-ring width chronologies back to the 18th century. This work has been supported by the German climate research programme DEKLIM and the Helmholtz Society.

Correction of precipitation simulated by General Circulation Models using Model Output Statistics

Simulating precipitation realistically is still a major challenge in climate modelling, because the spatial scales involved are often smaller than the gridcell size used in General Circulation Models (GCMs). I work with Jonathan Eden (University of Birmingham) on developing a method for statistically estimating regional precipitation using GCM-simulated precipitation as a predictor. This is an example for a Model Output Statistics correction method, which is conceptually different from the perfect-prog downscaling usually used in climate change studies. As part of this project we run the ECHAM5 GCM on the BEAR Linux cluster at the University of Birmingham. Once the correction method is developed, it will be applied to GCM simulations for the 21st century.

Data assimilation for palaeoclimatic applications

I have developed a pattern nudging method that allows the specification of large-scale circulation anomalies in general circulation models. This work is conducted in collaboration with Hans von Storch (GKSS Research Centre, Geesthacht), Reiner Schnur (Max Planck Institute for Meteorology, Hamburg) and Ingo Kirchner (Free University Berlin) and aims at providing a tool for assimilating large-scale circulation estimates derived from proxy data in simulations with general circulation models. This work has been supported by the German climate research programme DEKLIM and the Helmholtz Society.

Stability of teleconnections and of scale relationships

Together with Nikolaus Groll (GKSS Research Centre, Geesthacht) I have compared temperature teleconnections in the Eemian (the last interglacial about 125 ka ago) and in the preindustrial climate using simulations with General Circulation Models. We have also analysed relationships between large-scale atmospheric circulation and regional temperatures in these simulations. This work shows how orbital forcing changes the mean climate and thus in turn teleconnections and relationships between large-scale and regional climate. It has been supported by the German climate research programme DEKLIM.

Regional climate modelling for the European Alps

In collaboration with Kerstin Prömmel, Beate Mueller (GKSS Research Centre, Geesthacht) and Julie Jones (University of Sheffield) I am involved in the analysis of a regional model simulation over the Alps. We are exploring whether the high-resolution simulation adds value compared to the ERA40 reanalysis. We also are investigating mesoscale climate variability patterns in the region. This work has been funded through the EU Framework 5 project ALP-IMP.
