WHY RESEARCH RIPARIAN BUFFERS FOR FLOOD MANAGEMENT?

delivering benefits through evidence

Working with natural processes to
reduce flood risk

R&D framework: science report

Report – SC130004/R2

Flood and Coastal Erosion Risk Management Research and Development Programme

Research Gaps

Gap 5

New studies to improve evidence base

Gap 7

Experimental studies of WWNP

delivering benefits through evidence

Aquatic and riparian plant management:
controls for vegetation in watercourses

Technical guide

**Lack of research on riparian buffers
that directly look at hydrology and the
implications for flooding**

TARLAND CATCHMENT

RIPARIAN HYDROLOGY EXPERIMENT SITE (August 2014)

76km²

**Tributary to
River Dee in
Rural**

Aberdeenshire

**Dominated by
agriculture,
forestry and
heathland**

**Most recent
high flow
event:**

28/01/2014

RESEARCH OBJECTIVE & QUESTIONS

1. OBJECTIVE

Establish and compare riparian hydrological behaviour types and key event characteristics

2. QUESTION

During hydrological events, is surface runoff *out-with* a riparian buffer higher than surface runoff *within* an established riparian buffer?

INRIP

OUT-RIP

SURFACE RUNOFF
Vs.
SURFACE RUNOFF

3. QUESTION

During hydrological events, is there a lag-time between *soil moisture* peak and *surface runoff* peak

INRIP

OUT-RIP

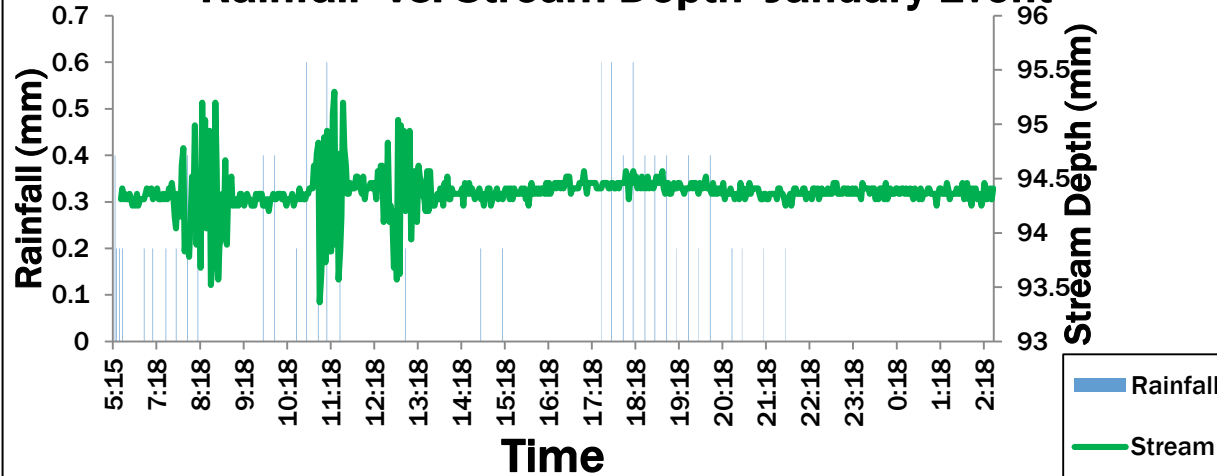

LAG-TIME
SOIL MOISTURE
Vs.
SURFACE RUNOFF

EXPERIMENT DESIGN

PRELIMINARY RESULTS JANUARY 2014 EVENT

Rainfall Vs. Stream Depth- January Event

KEY CHARACTERISTICS:

- Limited vegetation growth
- Wet antecedent conditions
- Elevated stable stream depth
- Likely elevated GW
- No crop in adjacent sloping field
- Rainfall: 2hr 15m heavy

RIPARIAN BEHAVIOUR:

- Runoff higher OUTRIP
- INRIP soil sustained high- little variance
- OUTRIP soil responds to rainfall faster & plateaus
- Stream is not affected
- **BUFFER PERFORMS AS EXPECTED**

Soil Moisture Vs. Runoff- January Event

JAN 2014	Time between:	
	Peak	Time to Peak
INRIP Soil Vs. INRIP Runoff	1hr 14min	1hr 10min
OUTRIP Soil Vs. OUTRIP Runoff	24min	1hr

PRELIMINARY RESULTS FEBRUARY 2014 EVENT

Rainfall Vs. Stream - February Event

KEY CHARACTERISTICS:

- Limited vegetation growth
- Wet antecedent conditions
- Elevated stable stream depth
- Likely elevated GW
- No crop in adjacent sloping field
- **First Rainfall: 12hr 45m prolonged heavy**
- **Second Rainfall: 4hr 30m heavy**

RIPARIAN BEHAVIOUR:

- Runoff higher OUTRIP
- INRIP soil sustained high- little variance
- OUTRIP soil responds to rainfall & plateaus
- Stream- very little increase
- **BUFFER PERFORMS AS EXPECTED**
- OUTRIP soil peak after OUTRIP runoff: GW influence?

Soil Moisture Vs. Runoff- February Event

FEB (a) 2014	Time between:	
	Peak	Time to Peak
OUTRIP Soil Vs. OUTRIP Runoff	0min	10min
FEB (b) 2014	Time between:	
	Peak	Time to Peak
OUTRIP Soil Vs. OUTRIP Runoff	SOIL 32min AFTER runoff	1hr 2min

PRELIMINARY RESULTS

MARCH 2014 EVENT- CONFLICTING EVENT

Stream Vs. Rainfall March Event

KEY CHARACTERISTICS:

- Limited spring vegetation growth
- Drier antecedent conditions than JAN/FEB
- Stable & lower stream depth
- GW likely to be low
- No crop in adjacent field
- **Sporadic short rainfall events**

Soil Vs. Runoff- March Event

RIPARIAN BEHAVIOUR:

- Runoff higher INRIP
- INRIP & OUTRIP soil sustained- no change
- INRIP soil consistently 23% wetter than OUTRIP soil
- Stream- insignificant increase
- Both runoffs react to rainfall: INRIP more reactive
- **BUFFER DID NOT PERFORM AS EXPECTED**

Lag-time could not be determined- soil does not react to the event

PRELIMINARY CONCLUSIONS

CONCLUSIONS:

- In January and February
 - the buffer behaved as expected and attenuates runoff (OUTRIP runoff is higher)
 - Lag-time requires further analysis
- In March
 - the buffer did not behave as expected and did not attenuate runoff
 - Lag-time could not be calculated: soil did not react to event
- Remains inconclusive how effective buffers are at attenuating runoff and reducing flood risk
- Requires extensive further research & long-term datasets

FURTHER WORK:

- Establish seasonal range of Key Characteristics & typical riparian behaviour (10 months more data collection)
- Statistically analyse these behaviours & determine any thresholds for effectiveness
- Utilise further data from GW and time-lapse camera
- Model (using SWAT) the catchment wide implementation of buffers and the effect on FR
- Use field data to calibrate model

THANK YOU

Any questions, comments or suggestions will be greatly welcomed and appreciated
