

# Local flood forecasting – From data collection to communicating forecasts

Paul Smith & Keith Beven  
([p.j.smith@lancaster.ac.uk](mailto:p.j.smith@lancaster.ac.uk))

# Local Flood Forecasting?

- Aim:
  - Provide forecasts at specific sites
- Why:
  - Complement existing systems
  - Provide forecasts in data poor areas
- Requirements:
  - Construct models from limited data
  - Quick, simple model construction
  - Present forecasts/warnings with minimal oversight

# Local Forecasting on the River Caldew

- Stead McAlpin Factory – flooded in Jan 2005 (almost in 2009 & 2010)

River Caldew  
and installed  
level sensor

# Case Study: River Caldew

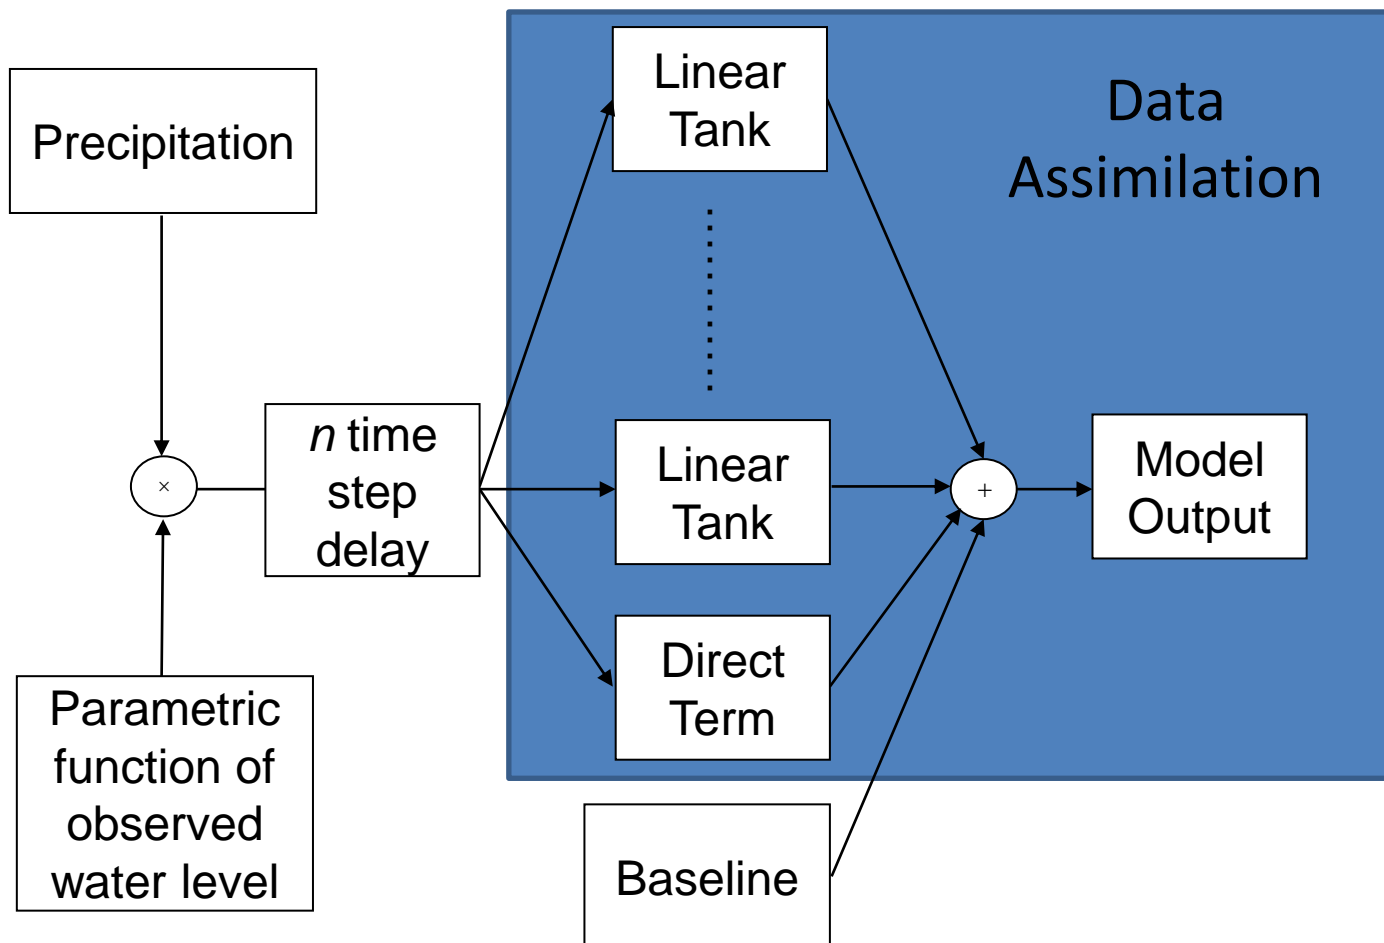

Lancaster  
Environment Centre

LANCASTER  
UNIVERSITY

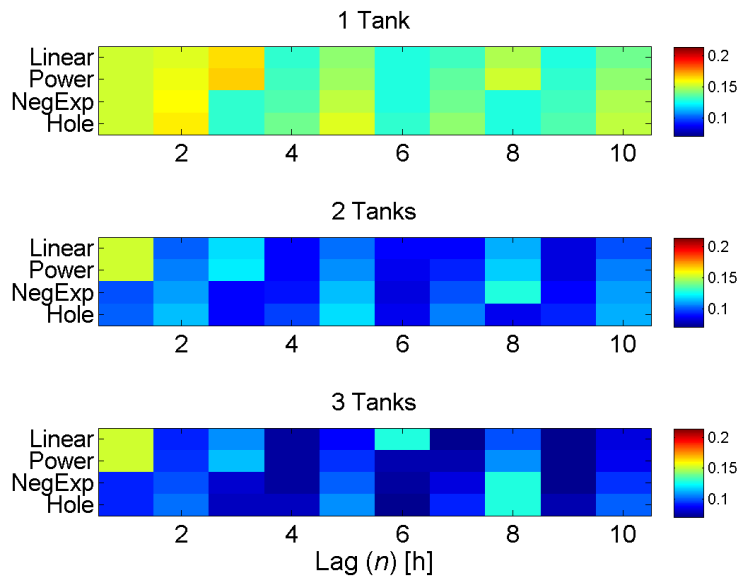

# Producing Forecasts

## *Data Based Mechanistic (DBM) Modelling*

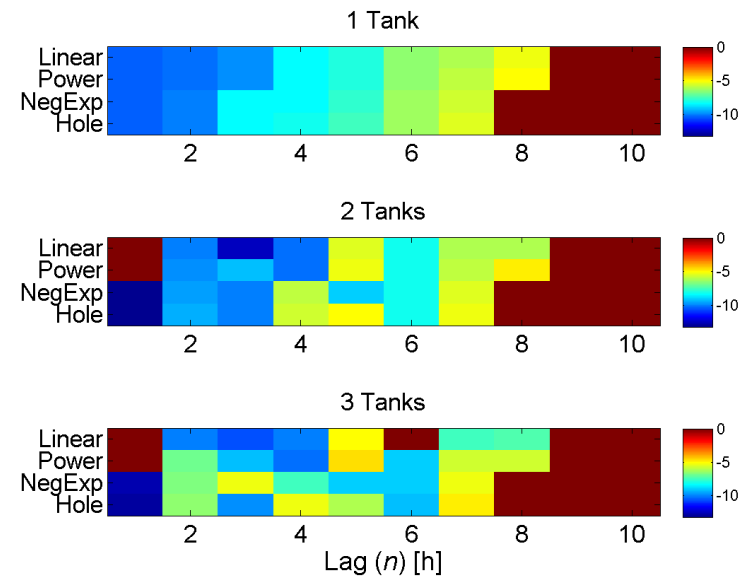

# Selecting a Model – Initial Screening

*Global Error Characteristics*  
*e.g. RMSE*

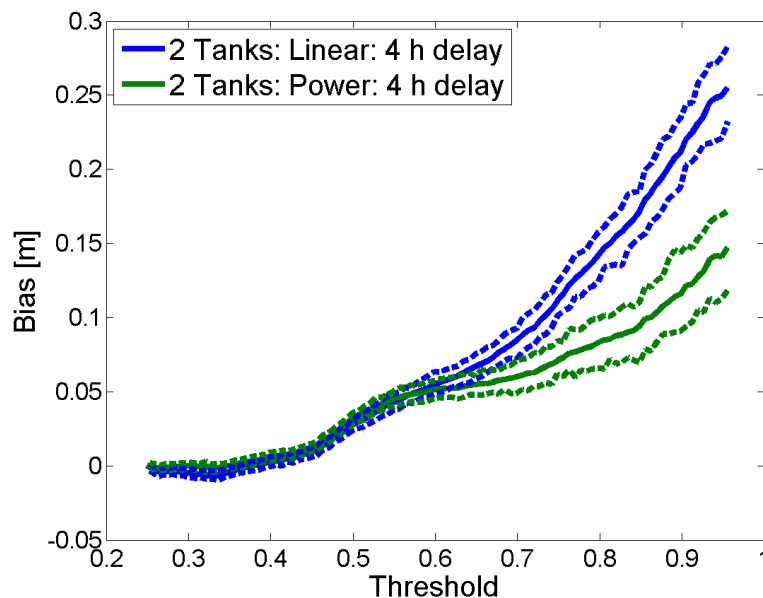

*Information Criteria*  
*e.g. YIC*

# Selecting a Model – Detailed Analysis

*Character of conditional errors*

*Hydrographs*

# Forecast Uncertainty & Confidence

- Uncertainty
  - Probability Statement about observed water level given forecast
- Confidence
  - Qualitative summary of faith in the Uncertainty assessment

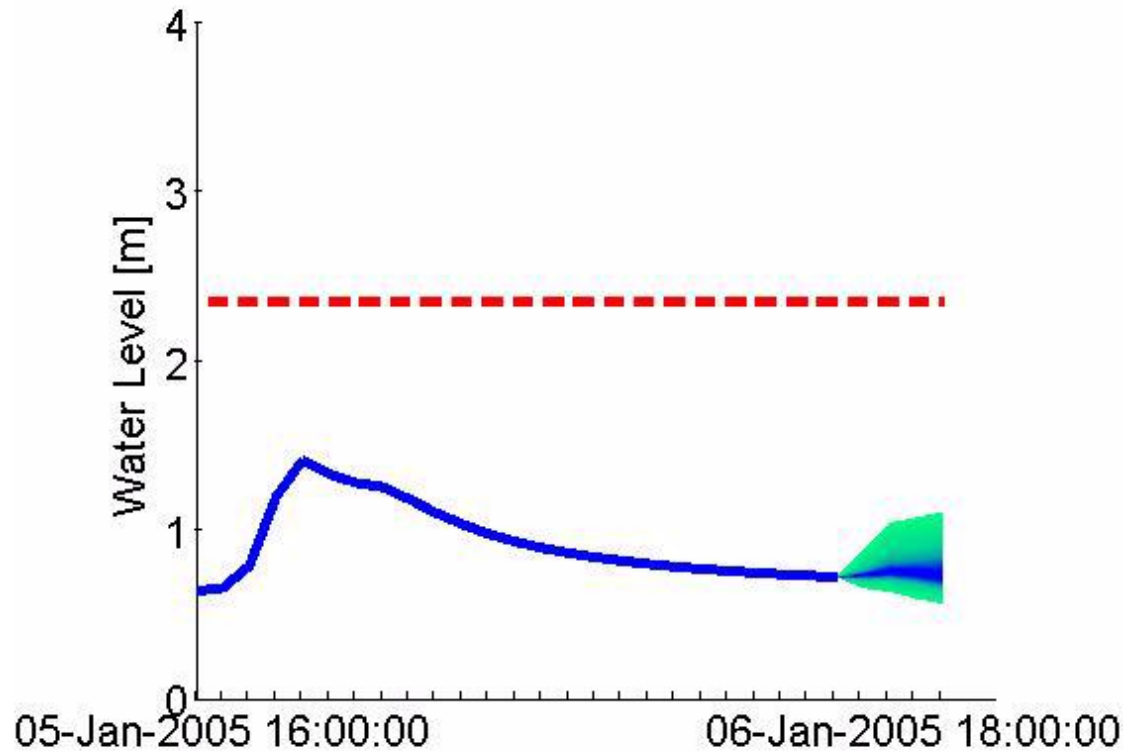

# Communicating Uncertainty & Confidence

## *Hydrograph*

- Shading indicates probability
- Transparency indicates confidence
- User calibration
  - Show past events
  - Examples of what might be likely/unlikely

# Summary

- Local forecasting introduces challenges
  - Data collection
  - Appropriate modelling
  - Data assimilation
  - Communicating forecasts
- Can address these
  - “Off the shelf” technology
  - DBM modelling
  - Careful visualisation
- Details, experience, tools
