

# Winter 2013-14: *“The Remote Control Flood”*

*And other tales of the advancement of hydrological science through technology....*

BHS Symposium, University of Birmingham  
September 2<sup>nd</sup> 2014

Nick Everard – Technical Adviser, Hydro-Acoustics  
Environment Agency, United Kingdom  
[nick.everard@environment-agency.gov.uk](mailto:nick.everard@environment-agency.gov.uk)

# The tale of a small green boat.....

.....and some pretty clever gadgets onboard

- Benefits during flood
- New applications after flood

.....but first, some history.....

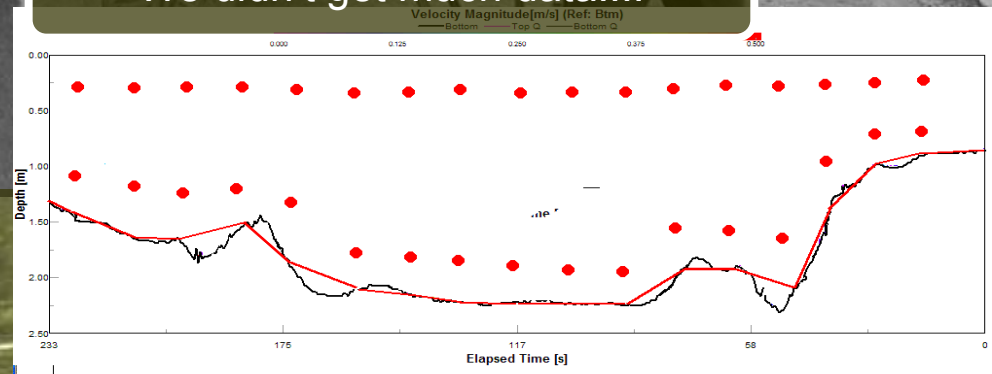

# Gauging – the bad old days

Gauging required many people and took a long time

Was potentially hazardous

We didn't get much data....

Cable across river

# 2002 – then came ADCPs

Deployed with ropes

- Bank to bank
- From bridges or cableways

- Efficiency increased greatly
- Much more data

But still some disadvantages: needed a bridge, access to both banks, cableway infrastructure, safety risks...

# Gauging – the bad old days...

Aaawww, this is a drag.  
There's got to be a better  
way.....

# 2012 - The ARC-Boat

A 2-metre long remote control river gauging and survey boat

Primary purpose is river flow measurements

Benefits:

- Quicker
- Safer
- Fewer staff
- Better data

Combined with GPS-equipped ADCP it makes great survey solution.

Winter 2013-14. It rained a bit.

Major flooding across much of the UK,  
throughout January and February

All Flood Alerts

Open

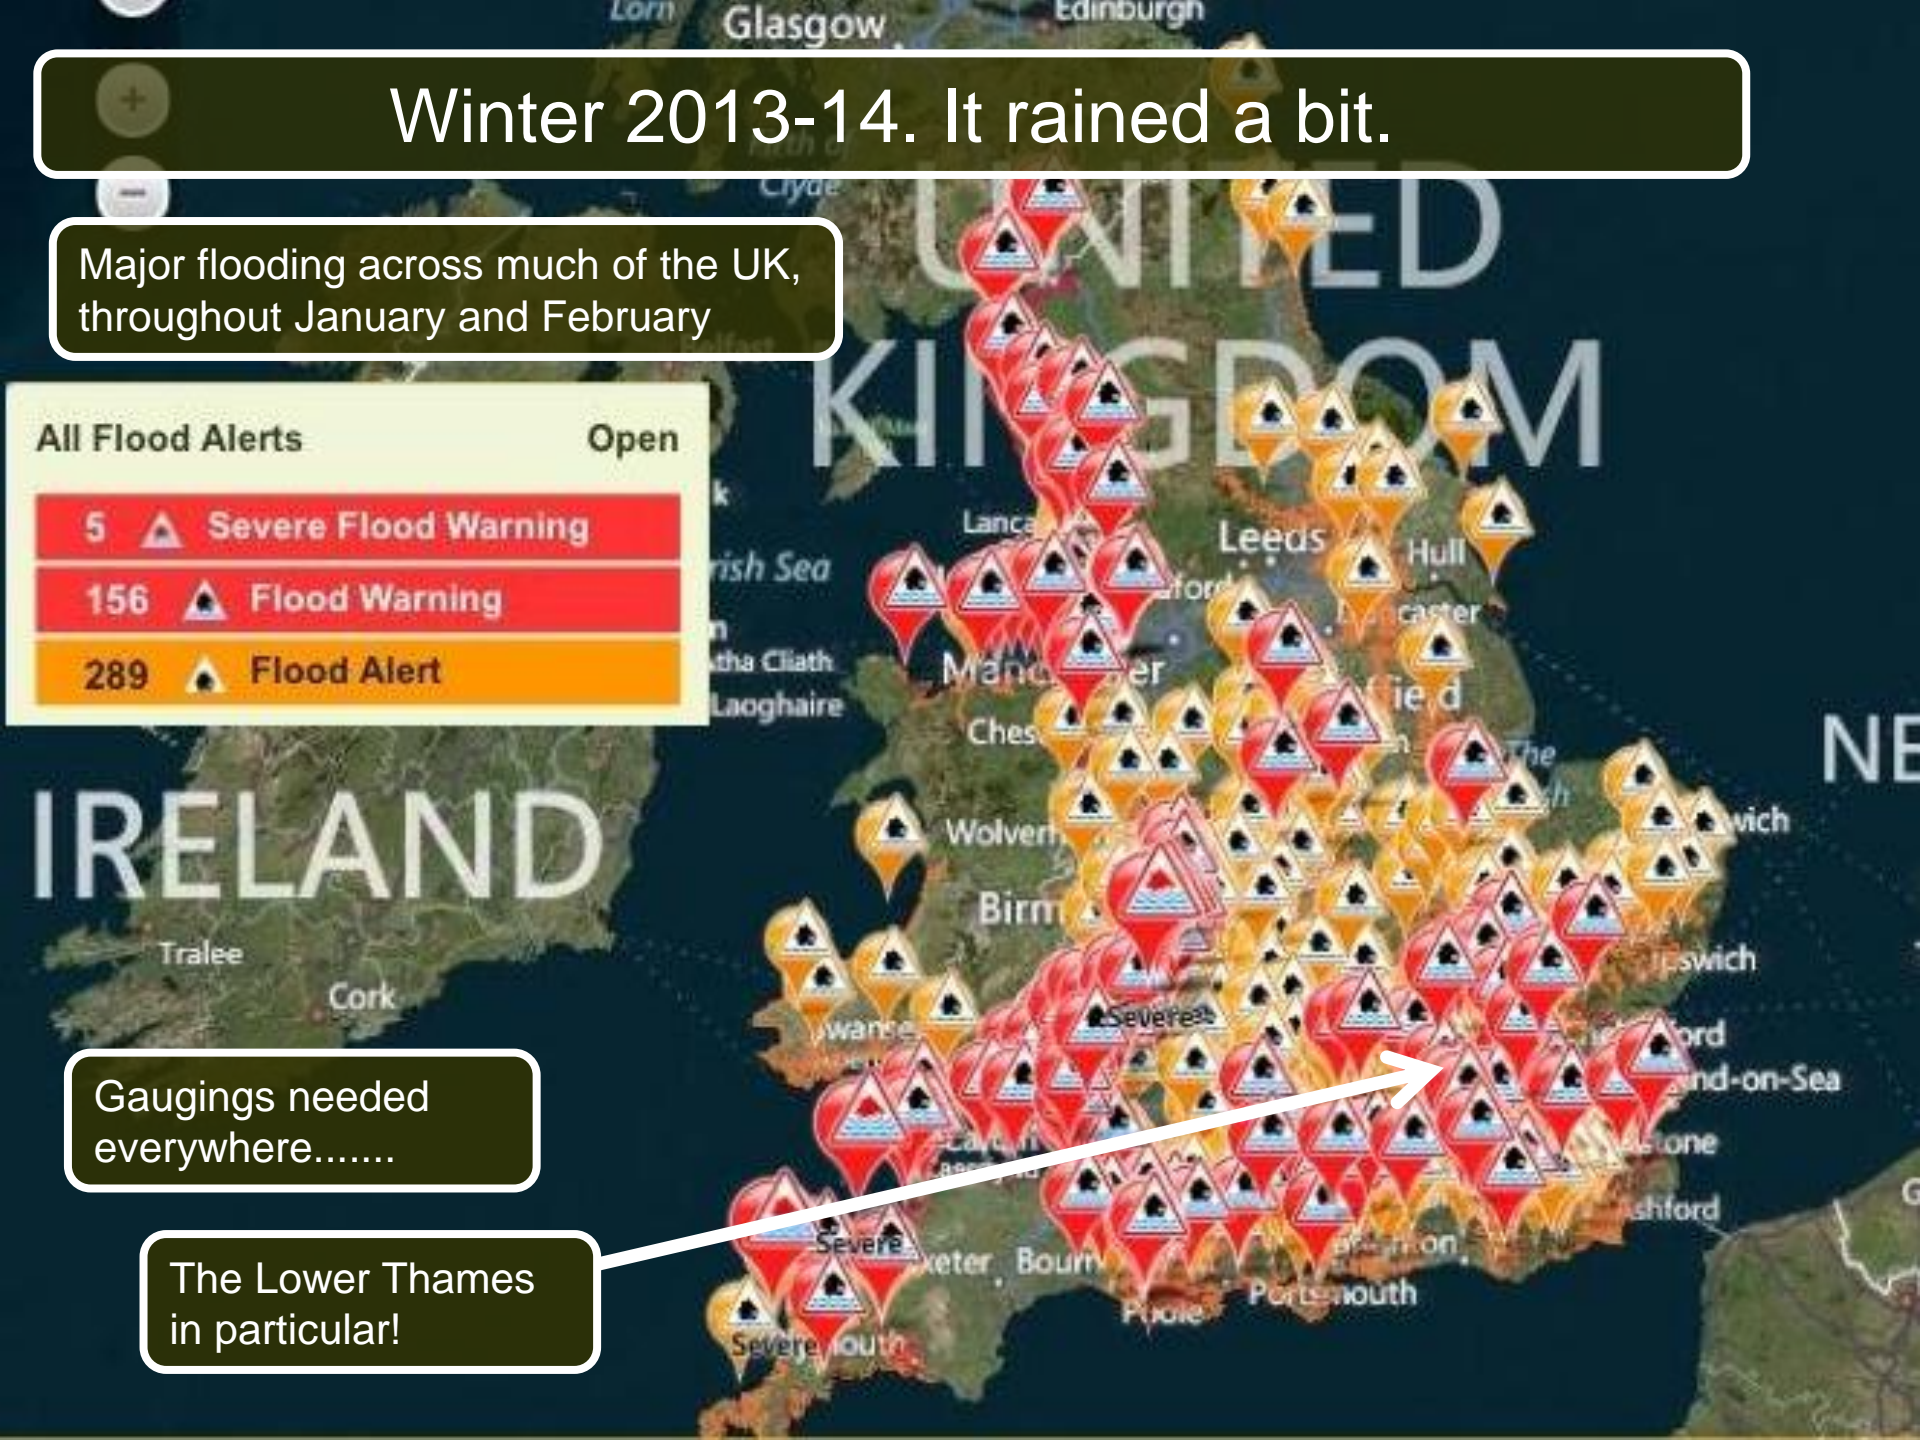

5 ▲ Severe Flood Warning

156 ▲ Flood Warning

289 ▲ Flood Alert

Gaugings needed  
everywhere.....

The Lower Thames  
in particular!

# Call for the ARC-Boat.....

Now 2 people can gauge up to 6 sites in a day.

Nobody goes in a boat.

Or dangles stuff  
off a bridge.

**All** gaugings on Lower Thames  
done with ARC-Boat and ADCP.

# River Thames January-February 2014

January/February 2014: **59** high flow gaugings on Lower Thames. **All used RC boat and ADCP.**

Lower Thames ARC-Boat gaugings in 2014 floods - total 59

# River Thames January-February 2014

At all sites on Lower Thames at least 5/10 highest ever gaugings this year, with RC boat.  
Highest ever gaugings at 4 sites

Highest gaugings in 2014 floods (out of top 10 highest)

And what about  
data quality.....?

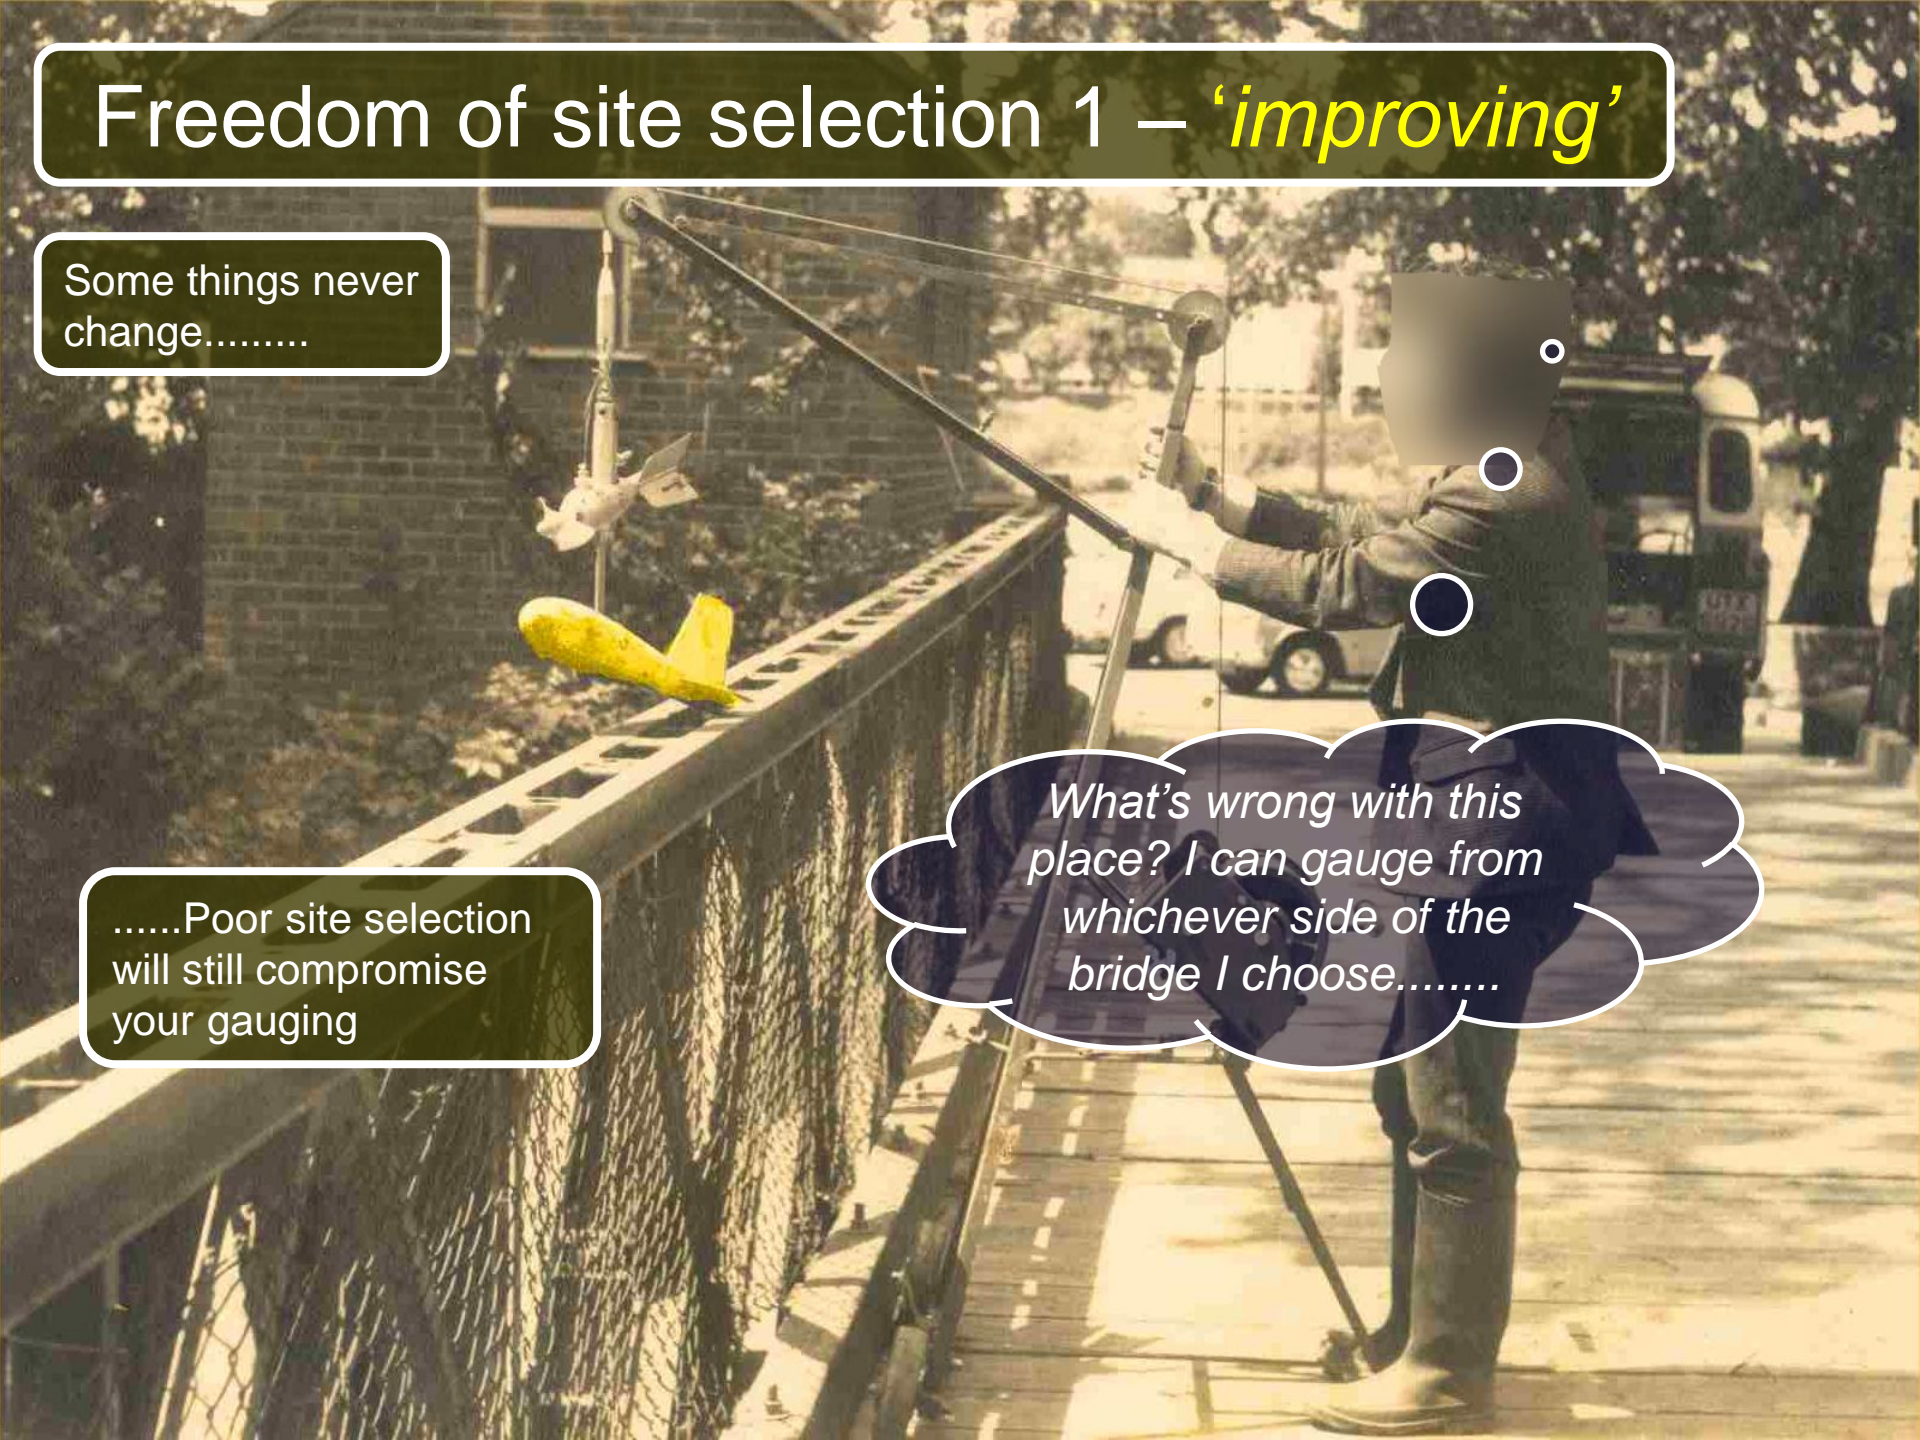

# Freedom of site selection 1 – *‘improving’*

Some things never  
change.....

.....Poor site selection  
will still compromise  
your gauging

*What's wrong with this  
place? I can gauge from  
whichever side of the  
bridge I choose.....*

# A bridge isn't always a great location....

R Thames at Maidenhead. Approx 170m<sup>3</sup>/s  
ADCP gauging DS face bridge

# Gauging with RC boat

Total Q m³/s	Delta Q %
173.323	0.02
168.994	-2.48
178.253	2.86
172.616	-0.39
173.297	-0.00
3.810	2.20
0.02	0.00

R Thames at Maidenhead. Approx 170m³s  
ADCP gauging 400m downstream bridge

# Freedom of site selection 2 – '*optimising*'

.....Yes, but '*Optimal*' site selection will *optimise* your gauging further

Ahhh, but this one's textbook right?  
Straight approach, no bridge, uniform depth

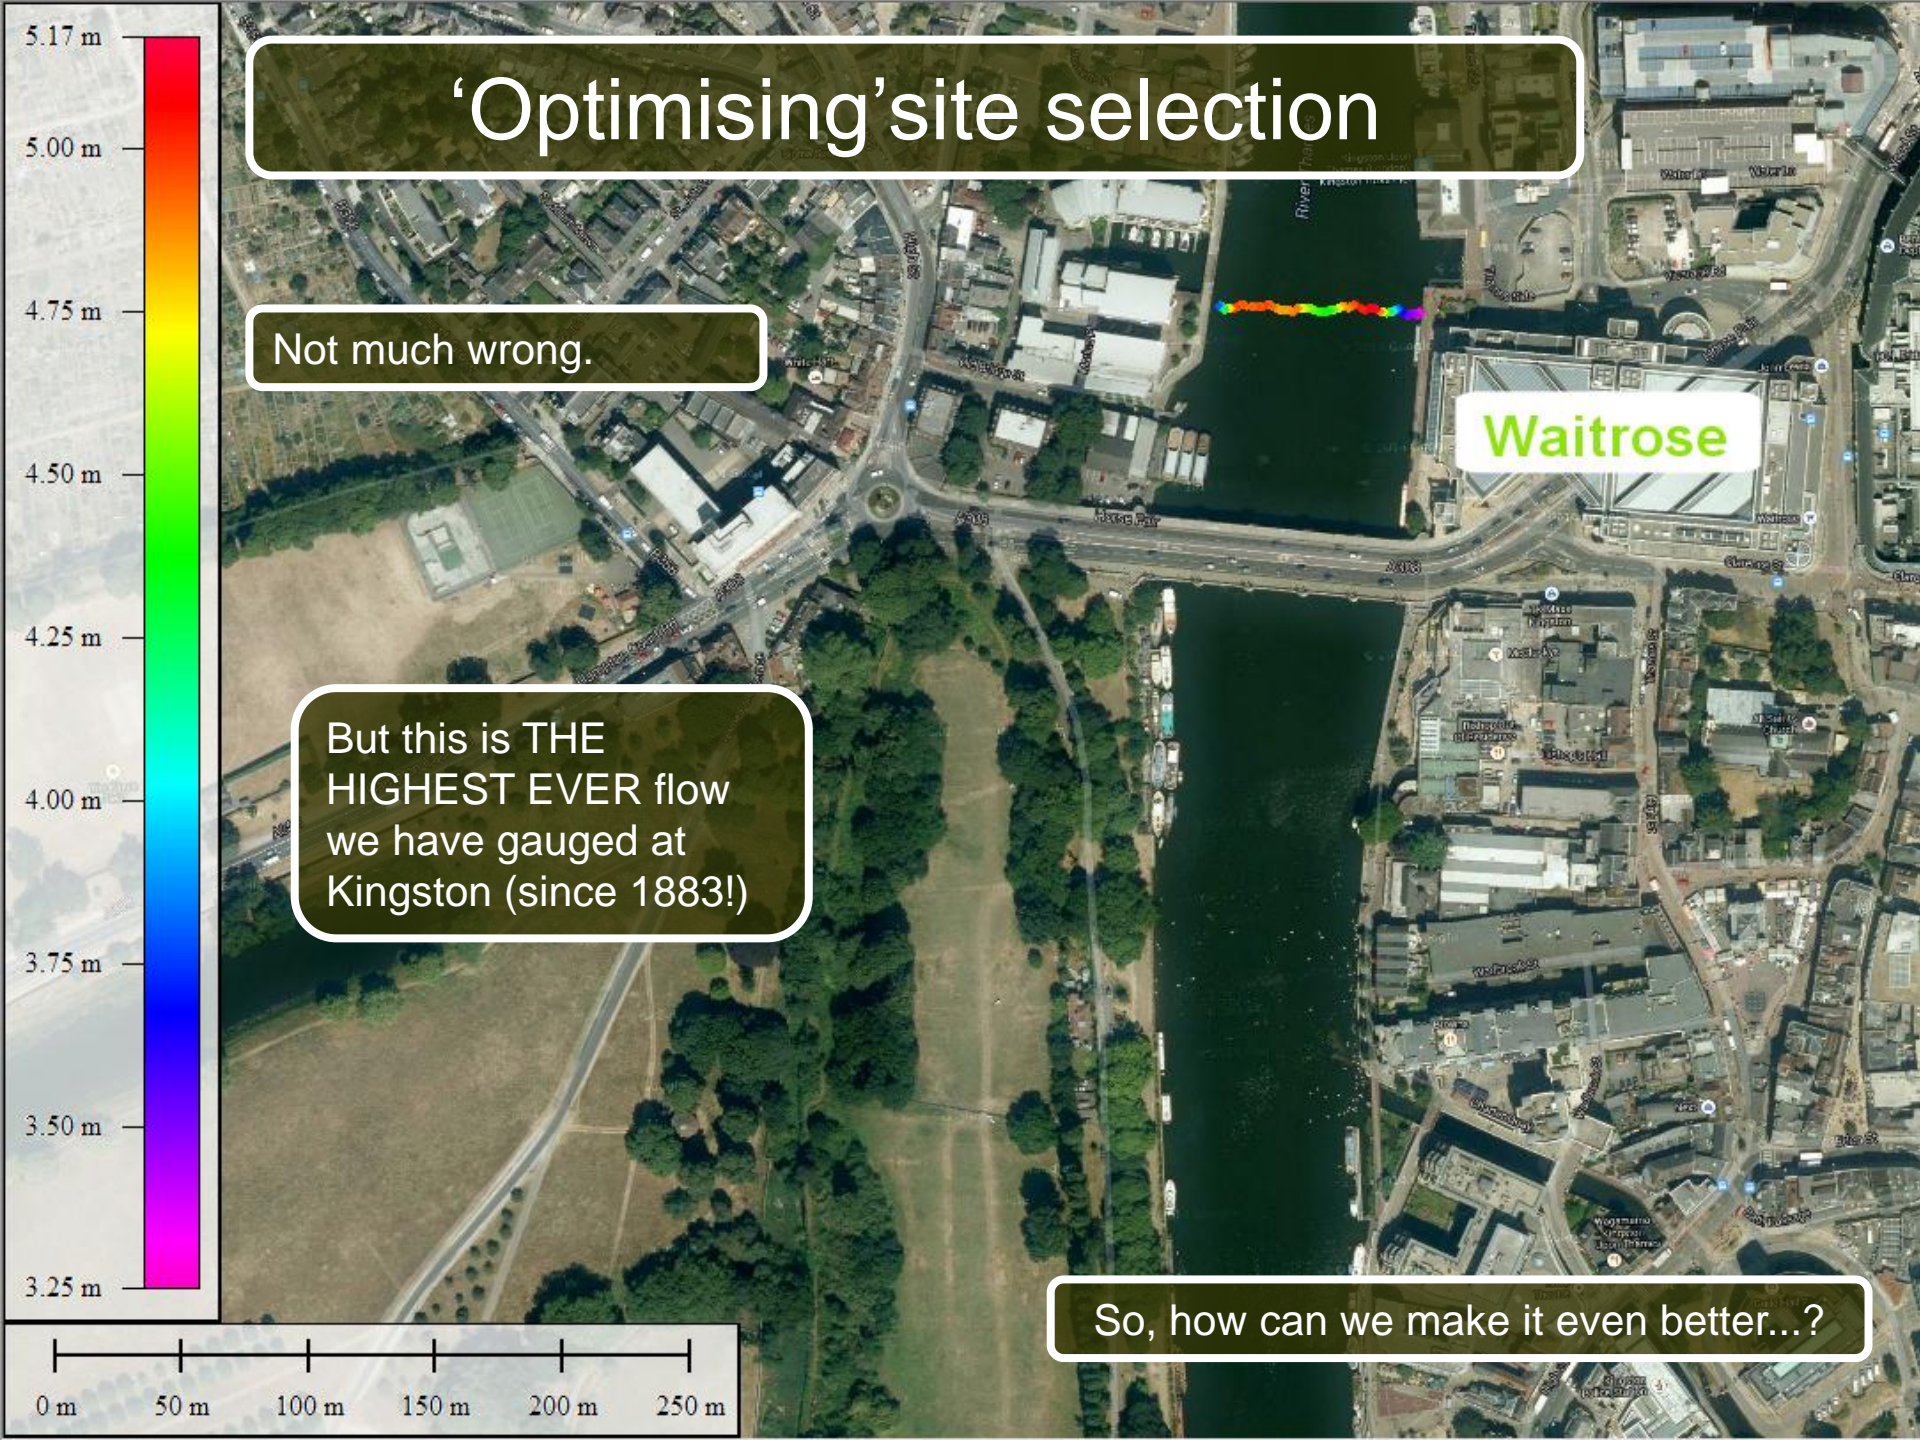

# ‘Optimising’ site selection

Not much wrong.

Waitrose

But this is THE  
HIGHEST EVER flow  
we have gauged at  
Kingston (since 1883!)

So, how can we make it even better...?

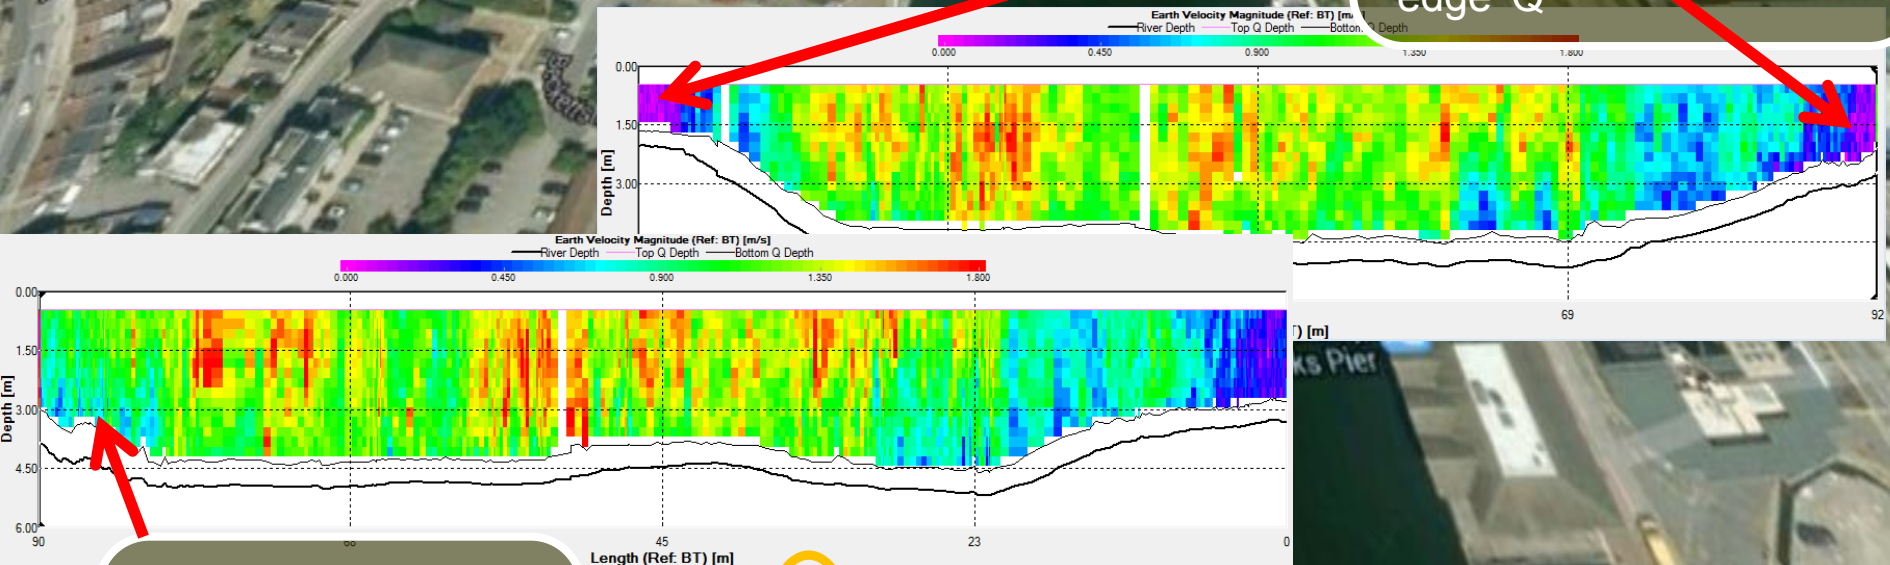

# Site selection - optimising

New site

- Very low velocities at both edges = reduced uncertainty in 'edge' Q

Original site:

- High velocity near both banks
- Far bank 90 metres away!

# After the flood – morphological impacts

Before the flood

Slight meander in immediate approach to weir.

River Kennet at Theale

# After the flood – morphological impacts

After the flood

1.5m deep scourhole  
under fallen tree

Bulk of flow pushed  
towards right bank?

Large deposit of  
gravels immediately  
upstream of weir  
(higher than weir crest!)

River Kennet at Theale

# After the flood – morphological impacts

Bed elevation difference

Scourhole under fallen tree

Small decrease in bed elevation

1.1m increase in elevation  
(higher than weir crest!)

River Kennet at Theale

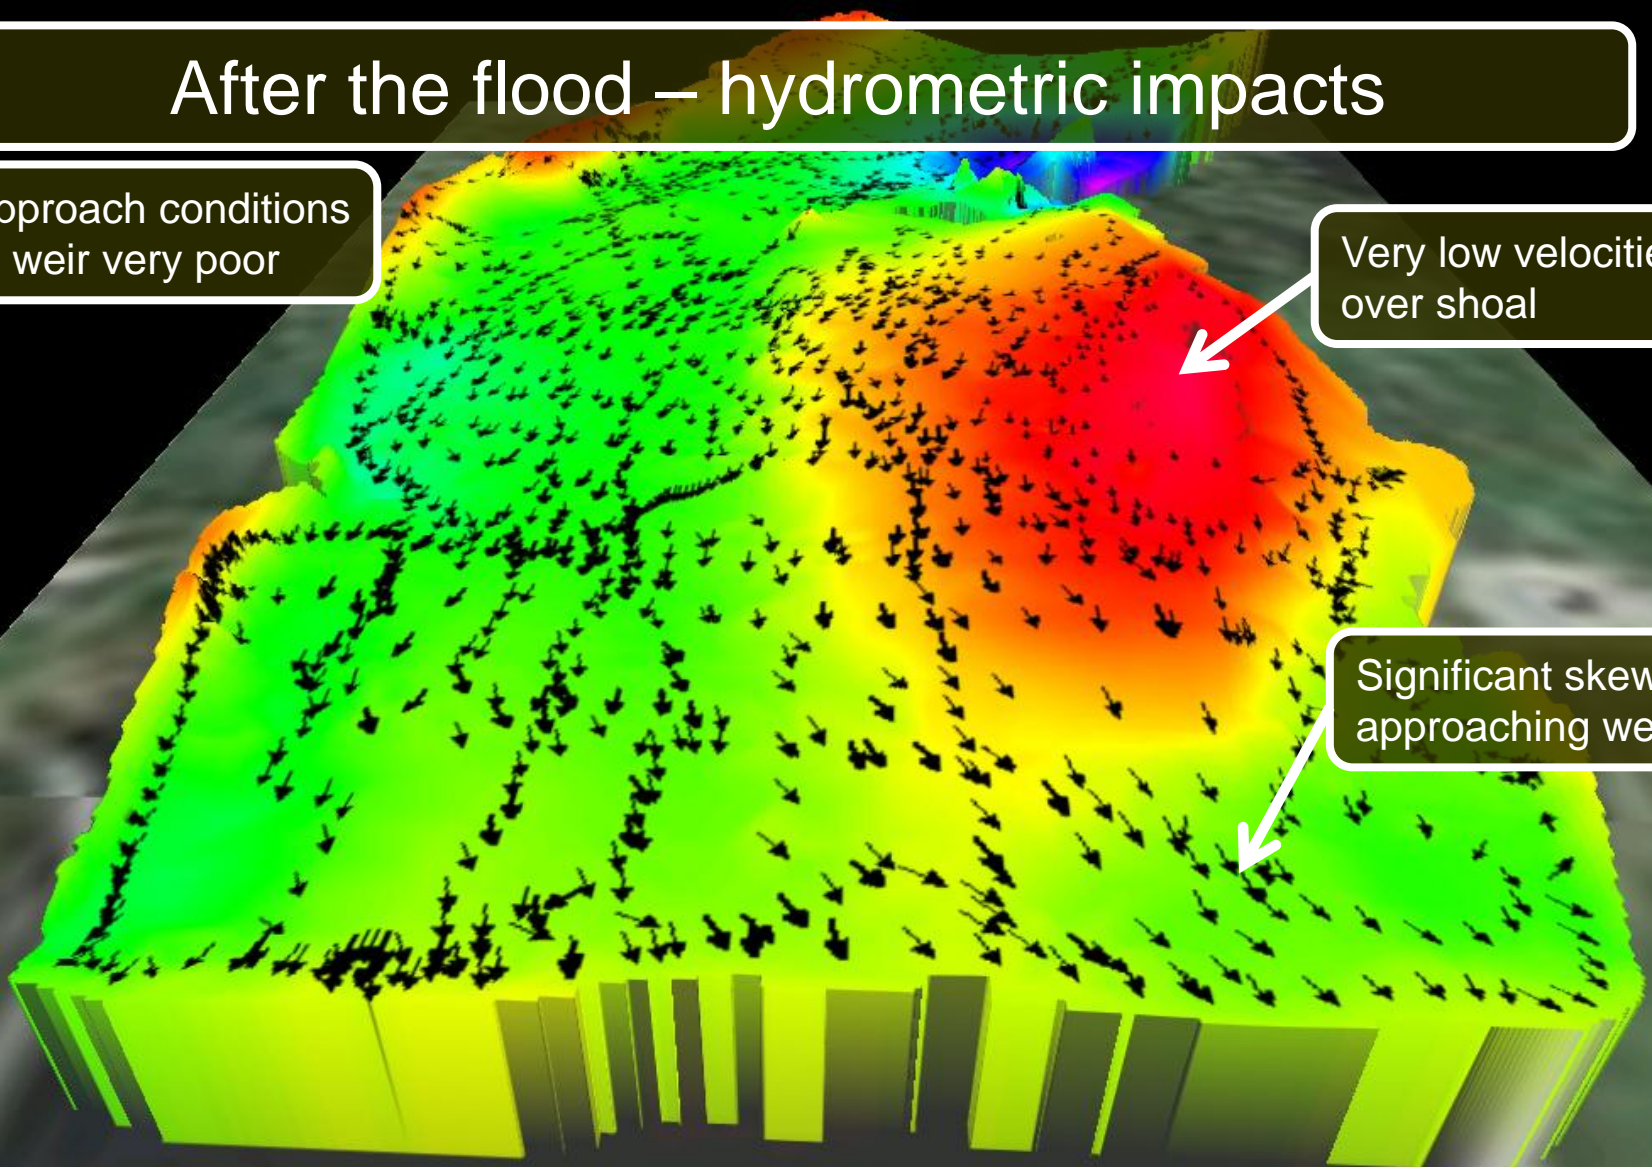

# After the flood – hydrometric impacts

Approach conditions  
to weir very poor

Very low velocities  
over shoal

Significant skew flow  
approaching weir

River Kennet at Theale

# After the flood

The river is on the move!

Several metres of northward migration of river channel.....

River Kennet at Theale

# Weirpool surveys for hydropower proposals

Weirpools on River Thames = a valuable habitat

ADCP and RC boat = a great tool to assess habitat by mapping bathymetry and velocity

But what impact a flood?

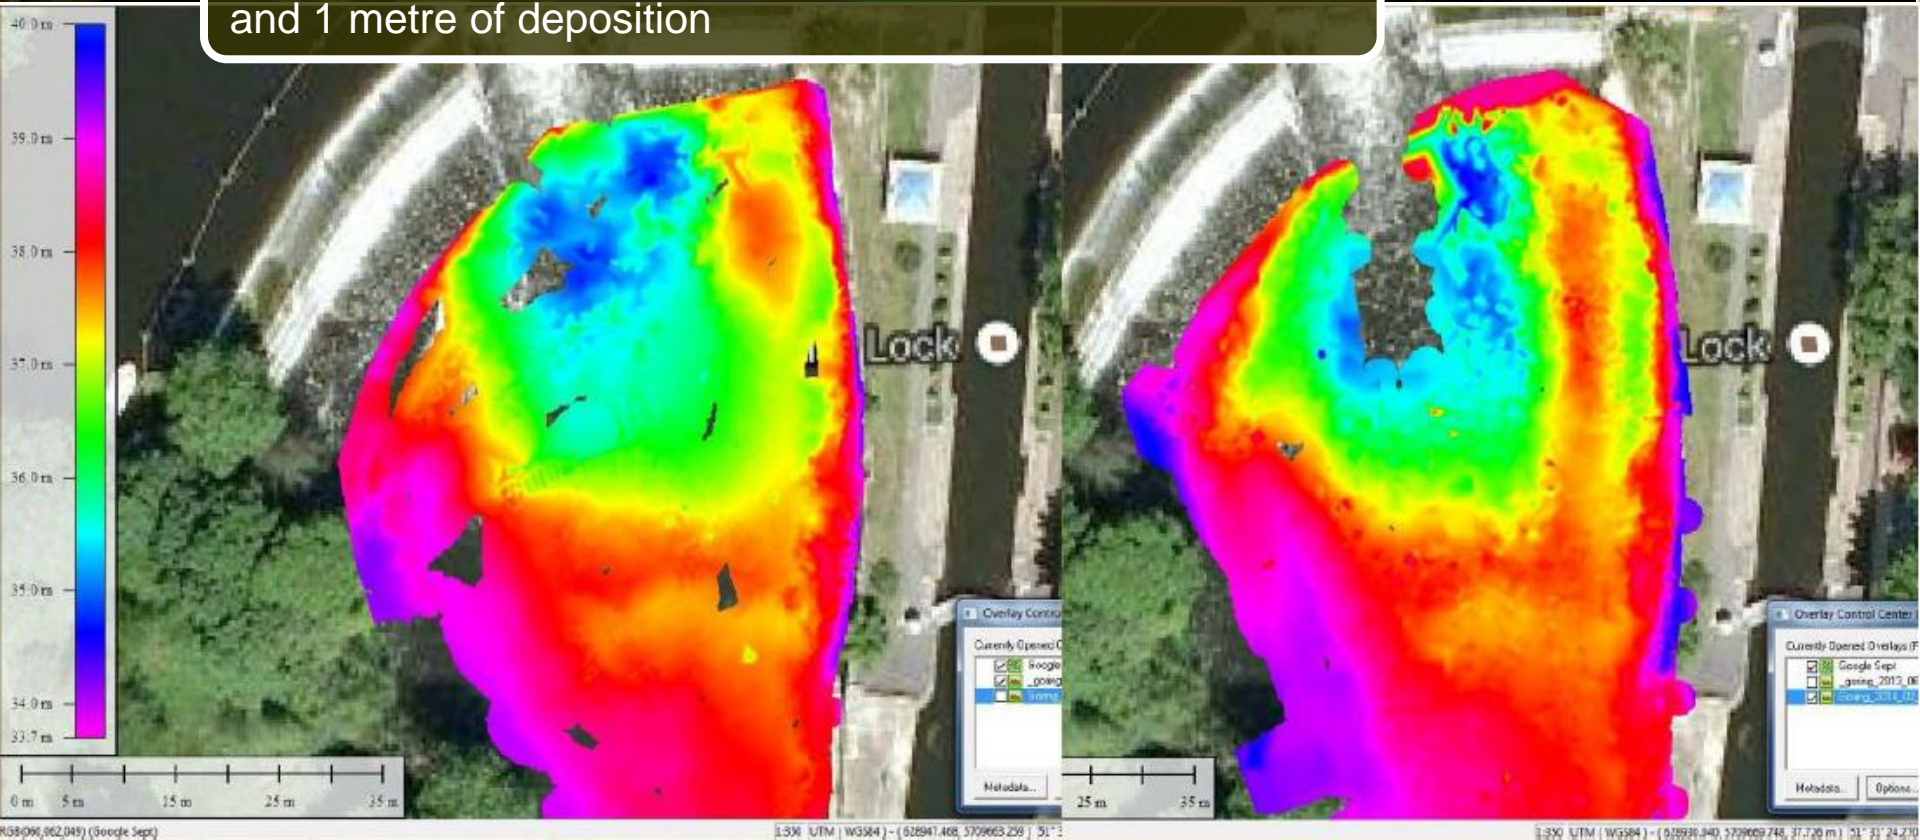

Weirpool survey, Romney Lock, River Thames

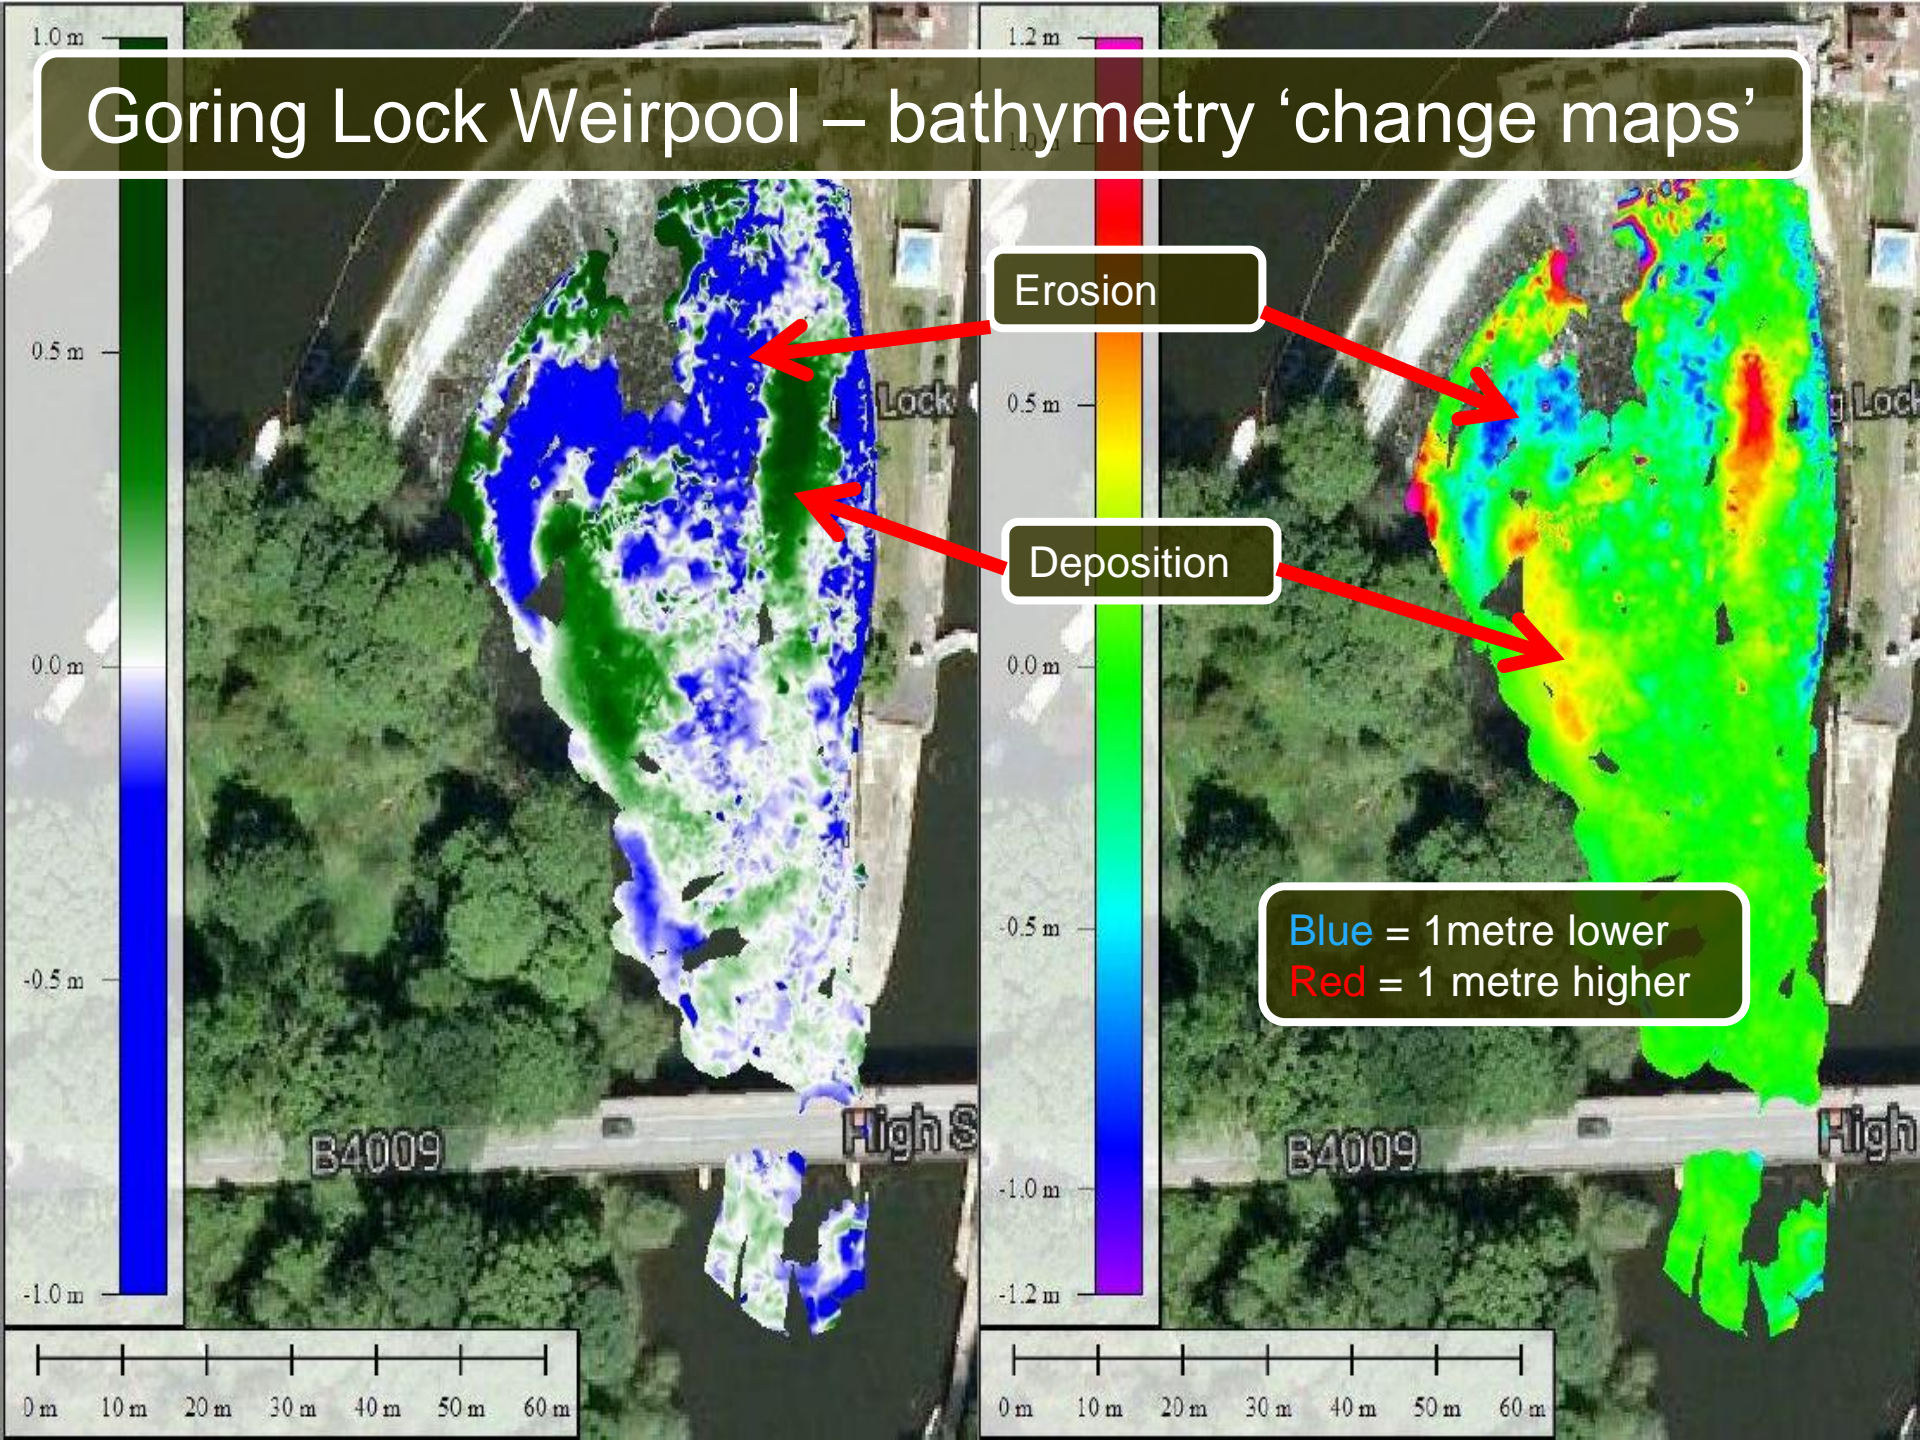

# Goring Lock Weirpool – before and after the flood

Significant changes in bathymetry – up to 1 metre of scour and 1 metre of deposition

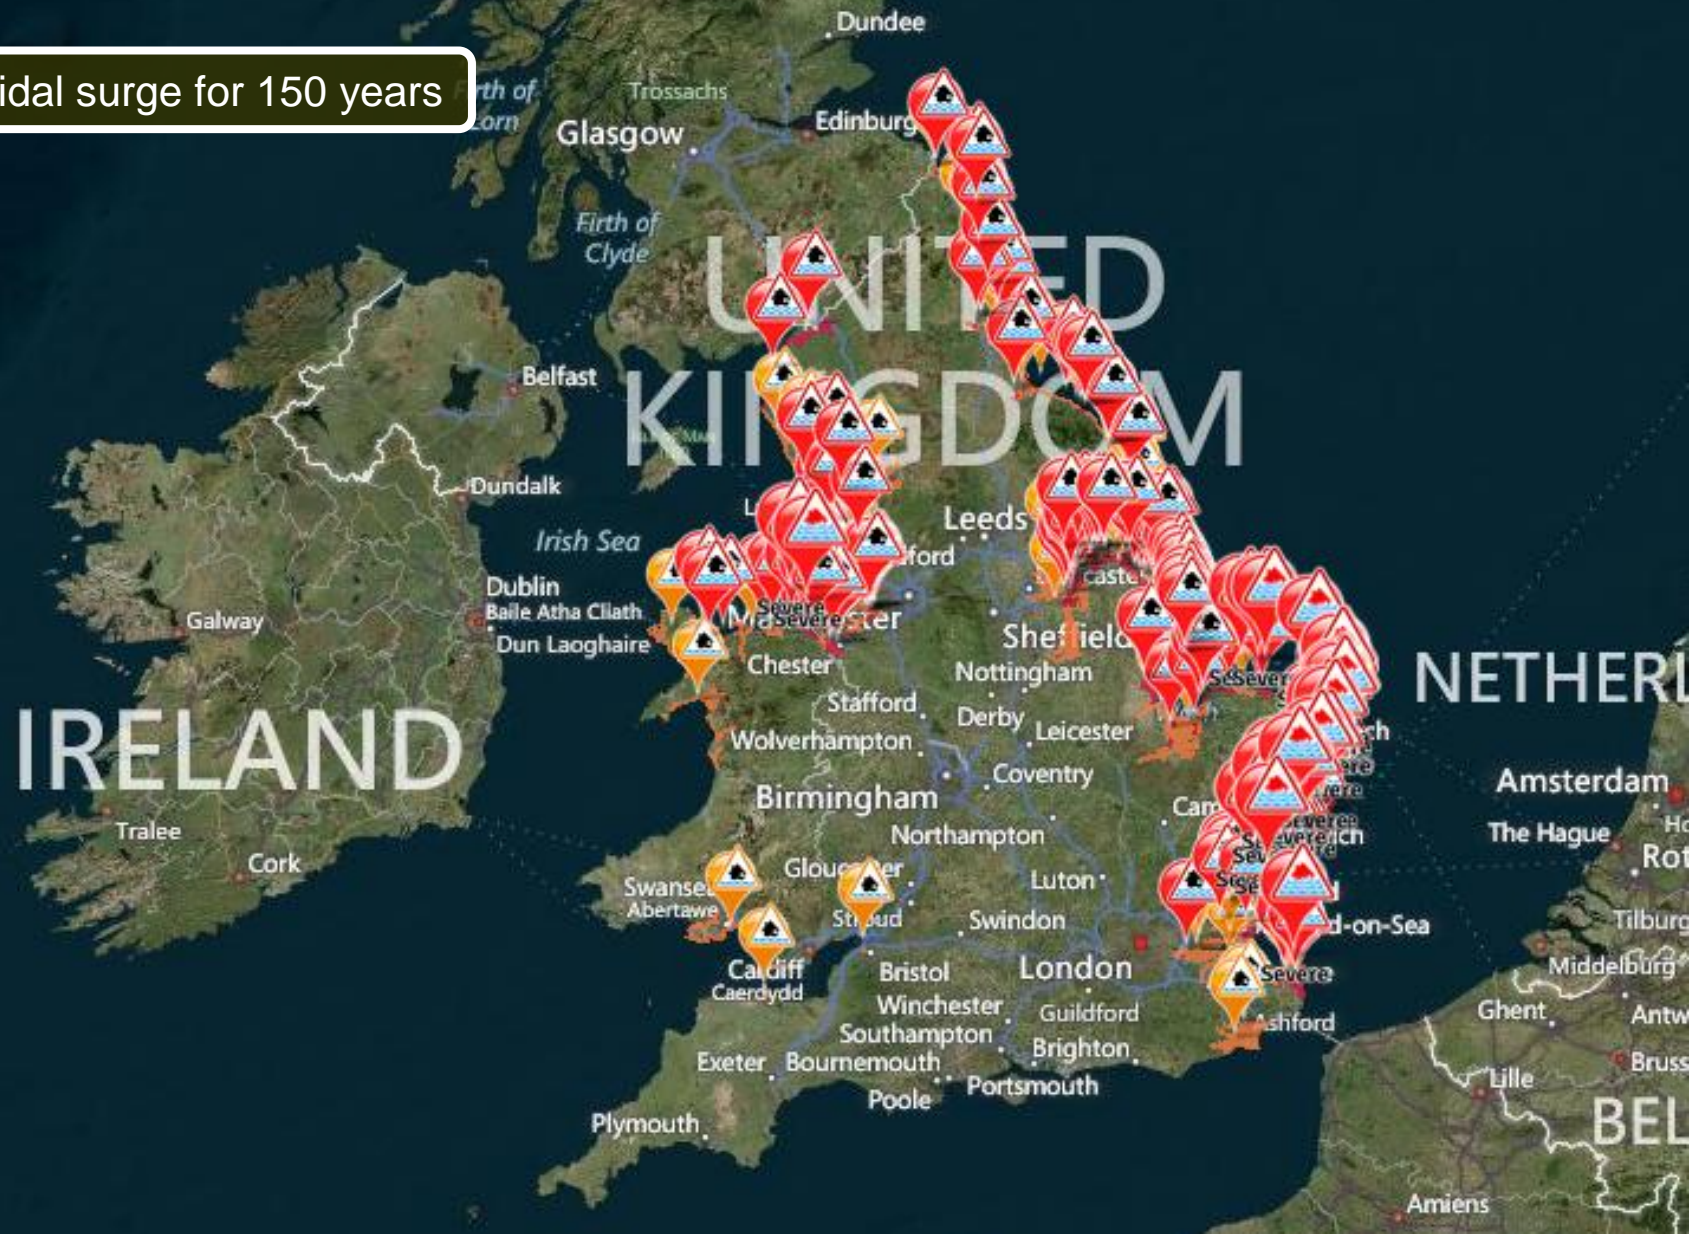

# Goring Lock Weirpool – bathymetry ‘change maps’

# East coast tidal surge December 2013

Highest tidal surge for 150 years

# East coast tidal surge – Seal Sands breach

80m breach in major coastal flood defence

# East coast tidal surge – Seal Sands breach

RAF Chinooks made  
temporary repairs

# East coast tidal surge – Seal Sands breach

ARC-Boat/ADCP survey attempt no.1

☑ Daylight  
☒ Low tide

# East coast tidal surge – Seal Sands breach

ARC-Boat/ADCP survey attempt no.2

☒ Night time  
☒ High tide

# Seal Sands breach

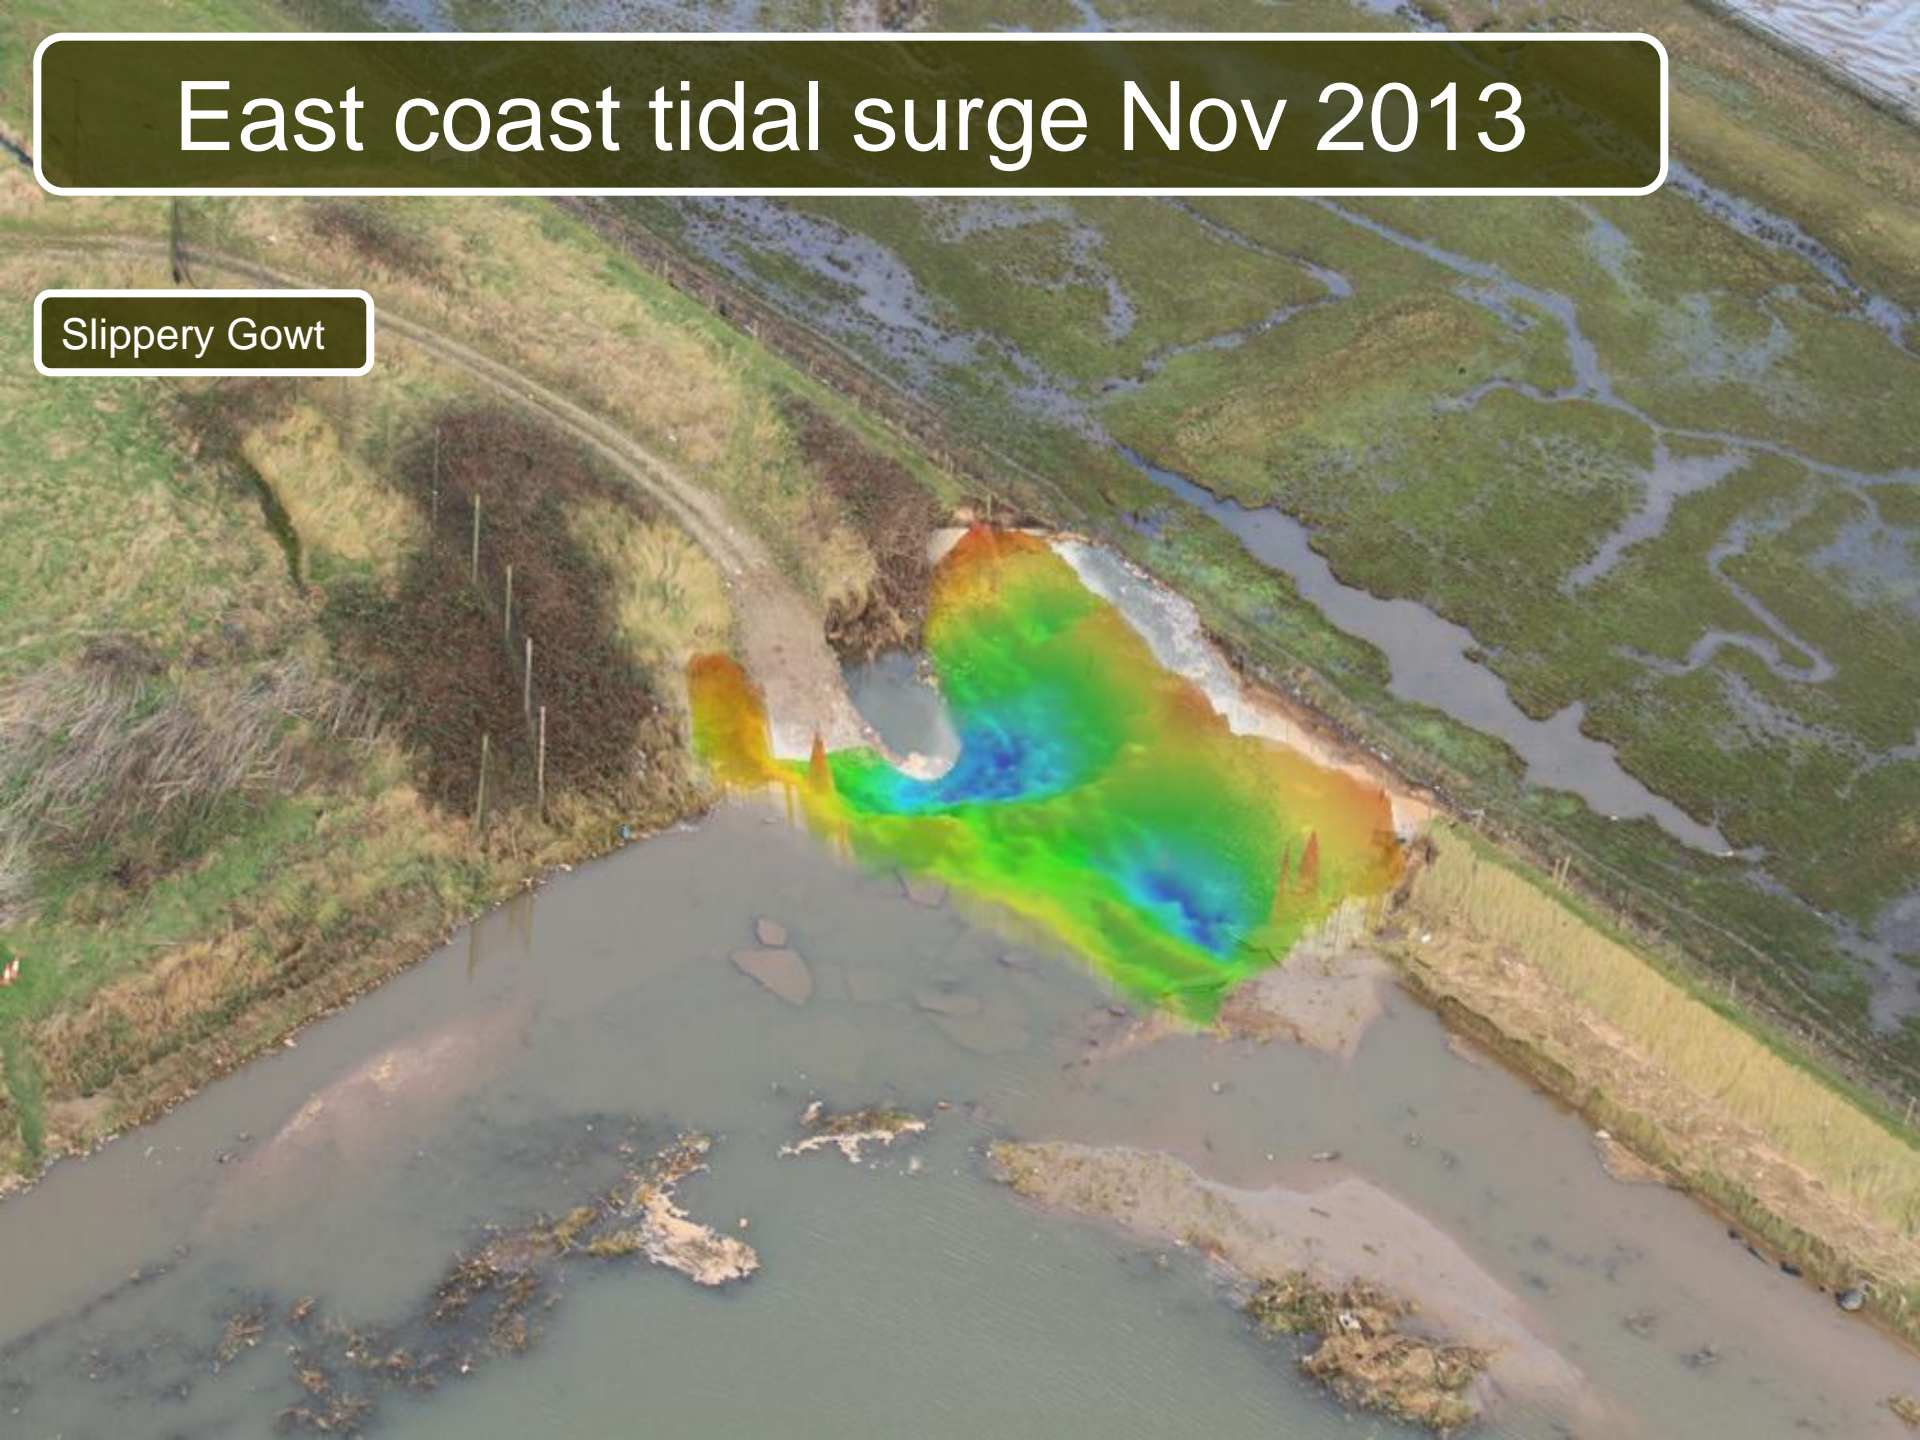

ADCP survey data, overlaid on  
Environment Agency Geomatics  
LiDAR data

# East coast tidal surge Nov 2013

Slippery Gowt

# Tidal defence repair – Slippery Gowt

Not a small repair job.....

# Meanwhile, in Somerset.....

Pre and post-dredge surveys

RC boat not used as very precise  
transect lines required

# Fish passage research – Thomas Kriechbaumer

*Understanding the effect of hydrodynamic conditions around barriers on fish is key to developing successful fish passes*  
(Williams et al., 2012).

Why do they go where they do?  
Will they use the £250k fish pass?

Key challenges:

- Site accessibility – getting to fish pass/weir
- What sampling strategy?
- ADCP flow homogeneity assumption
- Poor data in challenging conditions
- Limited sky view to GPS satellites
- Magnetic interference near banks

Many new technologies and techniques being explored...

# Coming soon - ARC-Lite

- Developed with Cranfield University
- Optimised for hydro-dynamics surveys
- Hydraulic factors influencing fish passage.

- Single person handling and operation
- Fit in small car
- Autonomous control
- Very low draft
- Accommodates all EA ADCPs

Oh yeah, and the  
media love the  
'drone boat'!

TV appearances on :

- CountryFile
- BBC news
- BBC Flood special

Thank you!

Environment  
Agency

OK, there are still a few sites where our marvellous boats may not work.
