# U Developments in Traction Systems B

**Stuart Hillmansen**  
University of Birmingham

Sustainable traction drives

## What is new in Traction?

- Physics of traction – no change there!
- Traction drives – lots of legacy stuff around
- Railway energy consumption – lots of concern about how to save energy
- Some new concepts for future traction
- Summary

Slide No: 2

BIRMINGHAM

Sustainable traction drives

## Overview of energy and power

- Linear motion of a railway vehicle can be described using standard equations of motion derived from Newton's Laws
- Force = Mass x Acceleration (Newton)
- Work Done = Force x distance (Joule)
- Power = Work Done / time (Watt)

Slide No: 3

UNIVERSITY OF  
BIRMINGHAM

Sustainable traction drives

## What is a Newton, a Joule or a Watt?

If we lift the apple through 1 metre in  
1 second then the power is:

$$P = \text{WD} / \text{time} = 1 \text{ Watt}$$

If we lift the apple up through 1 metre  
then the work done will be:

$$\text{WD} = F \times d = 1 \text{ Newton} \times 1 \text{ Metre} = 1 \text{ Joule}$$

$$F = M \times a = 0.1 \text{ kg} \times 10 \text{ m/s}^2 = 1 \text{ Newton}$$

Slide No: 4

UNIVERSITY OF  
BIRMINGHAM

Sustainable traction drives

So...

- A kettle boiling water is equivalent to 3,000 apples being lifted vertically at a speed of 1 m/s
- A Eurostar train at full power is equivalent to 12 million apples being lifted vertically at a speed of 1 m/s

Slide No: 5

 BIRMINGHAM

Sustainable traction drives

## Physics of traction

$$\text{Mass} \cdot \text{Acceleration} = (\text{Traction} - \text{Resistance} - \text{slope})$$

$$M(1 + \lambda) \frac{d^2s}{dt^2} = T - \left( c \left( \frac{ds}{dt} \right)^2 + b \left( \frac{ds}{dt} \right) + a + \frac{d}{r} \right) - (Mg\theta)$$

## Tractive and resistive forces

Slide No: 7

UNIVERSITY OF  
BIRMINGHAM

Sustainable traction drives

## Summary of traction

- Overall tractive effort is limited by number of driven wheels and maximum torque of the traction motors
- Once the constant power region is reached then the tractive effort drops off with 1/speed
- Possible to achieve good performance with low power and with distributed traction
- Distributed traction also improves regeneration potential

Slide No: 8

UNIVERSITY OF  
BIRMINGHAM

Sustainable traction drives

## Traction energy overview

- Energy in at pantograph
  - Auxiliary
  - Traction
    - Losses in:
      - Converters
      - Motors
      - Resistance to motion – slow trains down?
      - **Kinetic energy recovery (last low hanging fruit)**

Sustainable traction drives

## Options for energy storage 1

- Onboard storage
  - Diesel electric multiple units
  - Diesel multiple units
  - Locomotives
  - Shunting locomotives
  - Electric multiple units

Slide No: 10

UNIVERSITY OF  
BIRMINGHAM

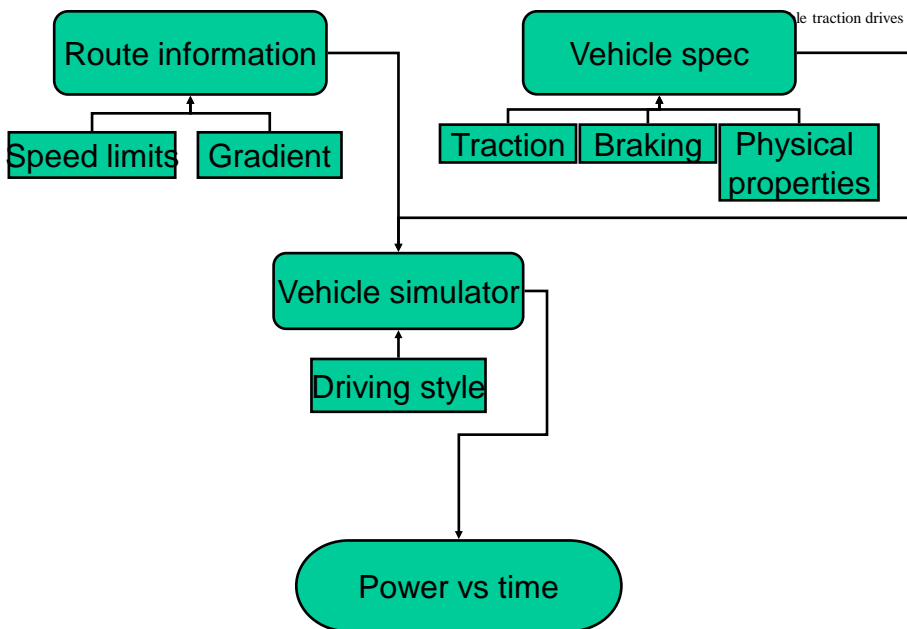

Sustainable traction drives

## Options for energy storage 2

- Wayside storage (fixed installations)
  - DC railways
    - Load levelling
    - Regeneration capture and reuse
  - AC railways – not such an important issue

## Important features of braking

- At high speed – it is very difficult (impossible) to capture all the braking energy.
- Constant power braking is required to get the most out of regenerating systems
- Using constant power and all electric regeneration will lead to longer journey times – unless you put big machines in the train

Slide No: 15

UNIVERSITY OF

## Energy Storage Capability (in MJ/kg)

- Compressed natural gas (CNG): 50 MJ/kg
  - But pressure vessel weighs a lot
- Petrol: 44 MJ/kg
- Diesel fuel: 39-42 MJ/kg
- Ethanol: 30 MJ/kg
- Coal: 29 MJ/kg
- Biomass: 15 MJ/kg
- Liquid petroleum gas (LPG): 45-50 MJ/kg
- Steel flywheel: 0.014 MJ/kg
- Battery: 0.01-0.56 MJ/kg

## Hayabusa

- Developed by Hitachi, Porterbrook, Brush Traction, and Network Rail.
- Class 43 fitted with 4 Hitachi 300 kW AC traction motors.
- Hitachi lithium-Ion batteries used as the ESD
  - 48 batteries, 960 kg battery weight
  - Capacity: 48 kWh
  - Maximum power output: 1 MW for 170 seconds

Hayabusa series hybrid scheme UNIVERSITY OF BIRMINGHAM

Sustainable traction drives

## EMUs with energy storage

- Provides power in the event of supply failure
- Can improve energy efficiency on DC railways (with long headways and low voltage DC supplies)
- Can power train on sections of track which are not electrified
- No commercial main line trains are currently available – but there are some light rail examples
- IPEMU trial

Sustainable traction drives

## Wayside energy storage

- Essentially same principles apply:
  - Need to consider the supply duty cycle
  - Careful positioning of equipment
  - Range of storage technologies to consider
    - Capacitor
    - Battery
    - Flywheel
  - Can lead to energy savings – but these are harder to realise in an electric railway – and the economic case is not there yet.

## Beijing Yizhuang Metro Line field test

上行1: 亦庄火车站至次渠1  
 Up direction: Yizhuang Railway Station to Ciqi

当前工况: **牵引**  
 Current movement mode: *Motoring*

目标速度: **35** 公里/小时  
 Target speed: 35 km/h

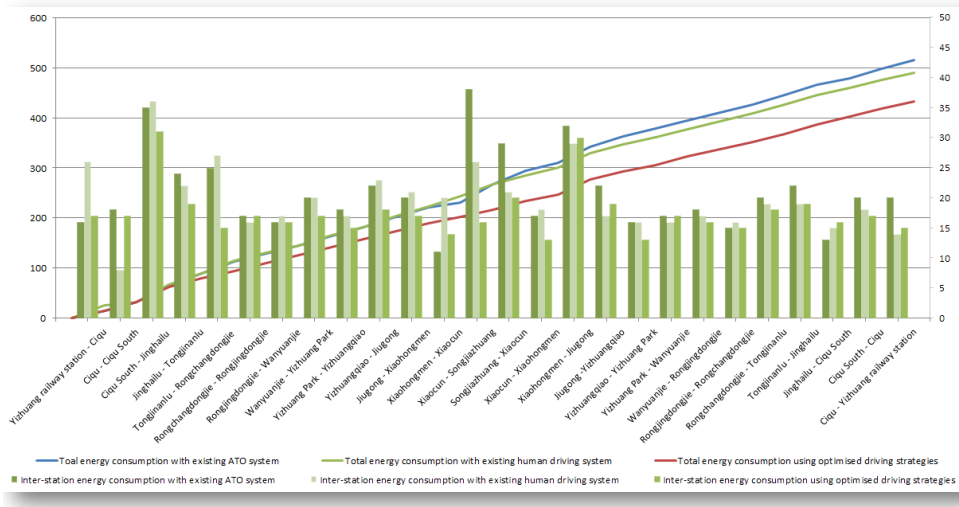

目标距离: **79** 米  
 Target location: 79 km/h

**12** 秒后, 转换工况为 **巡航**  
 Seconds later, change to *Cruising*

Sustainable traction drives

## And for where we don't electrify we have the option of fuel cell trains

- Benefits of electrification without OLE
- Zero emissions at point of use
- Lots of ways of making the H<sub>2</sub>

Slide No: 35

UNIVERSITY OF  
BIRMINGHAM

Sustainable traction drives

## Summary

- Railway traction is fundamentally sustainable
- Kinetic energy recovery can improve overall energy efficiency
- Energy storage solutions are being trialled in many different railway applications
- The economic case is still a bit uncertain
- The performance of energy storage is likely to improve and we are likely to see wide scale implementation of these systems in the future
- Duty cycle is the most important factor to consider when thinking about energy storage devices
- Power electronic traction substations have the possibility to revolutionise the railway power system and be a key part of the smart railway power grid
