

Angiotensin Converting Enzyme inhibitor (ACEi) / Angiotensin Receptor Blocker (ARB) – To STOP OR Not in Advanced Renal Disease

Launch Meeting

3rd April 2014, Lucas House, Birmingham

Prof Sunil Bhandari
Consultant Nephrologist
Honorary Clinical Professor

UNIVERSITY OF
BIRMINGHAM

Hull and East Yorkshire Hospitals

NHS Trust

Aims

- Background and Rationale
 - Limiting renal progression
 - Cardiovascular disease and the kidney
 - Equipoise
- Trial Design
- Eligibility Criteria
 - Inclusion
 - Exclusion
- Objectives
 - Primary
 - Secondary
- Screening and Consent
- Trial Procedures/Assessments

The Renin-Angiotensin-Aldosterone System

Seminal - Lewis Studies

Lewis et al NEJM 2001

RCTs Demonstrating Benefit of ACEi and ARB on Kidney Outcomes

Study	N	Study arms	Study population	Proteinuric at baseline %	Proteinuria reduced	Renal outcome
REIN	352	Ramapril Placebo	Non diabetic CKD	100	Yes	Decline in GFR
AIPRI	583	Benazapril Placebo	Non diabetic CKD	100	Yes	Doubling Scr or ESRD
RENAAL	1513	Losartan Placebo	Type II diabetes with Nephropathy	100	Yes	Doubling Scr or ESRD, death
IDNT	1713	Irbesartan Amlodipine placebo	Type II diabetes with Nephropathy	100	Yes	Doubling Scr or ESRD, death
AASK	1089	Ramapril Amlodipione Metoprolol	Hypertensive nephrosclerosis	33	Yes	Decline in GFR
Captopril LEWIS	409	Captopril Placebo	Type I diabetes with Nephropathy	100	Yes	Doubling Scr
Cooperative	240	Trandolaprol Losartan Comination	Non diabetic CKD	100	Yes	Doubling Scr or ESRD
Advanced CKD	328	Benazapril plaebo	Non diabetic CKD	100	yes	Doubling Scr or ESRD, death

RENAAL: Antiproteinuric effect of losartan explains the renal protective effect

	Outcome		Outcome Adjusted for proteinuria	
	RR (97% CI)	P value	RR (97% CI)	P value
Primary Composite	16.1 (2.5-27.8)	0.022	1.7 (-14.5-15.5)	0.829
ESRD	28.6 (11.5-42.4)	0.002	14.1 (-6,6-30.8)	0.168

Studies with Renal Endpoints with RAAS blockage ? Generalisation to all levels of CKD

Studies demonstrating differences in renal endpoints		
Non diabetic	Baseline GFR (ml/min)	diabetic
MDRD	40	Captopril
AIPRI	52	IDNT
REIN	56	RENAAL
AASK	46	Bakris et al
COOPERATE	51	
Studies demonstrating no difference in renal endpoints		
diabetic	Baseline GFR	Diabetic & non diabetic
ABCD	84	Casas J
Barnett A et al	93	ALLHAT
ACCOMPLISH	45	BENEDICT

ACEi in advanced CKD creatinine > 273 μ mol/L

422 patients with non-diabetic CKD :

Group 1: (SC 133-265 μ mol/L)
received 20mg of benazepril/day

Group 2: (SC 274-442 μ mol/L)
randomised to 20mg of
benazepril/day or placebo and
then followed for 3.4 years

43% decrease in the composite
end point of doubling of serum
creatinine level, ESRD, or death
in the benazepril group
compared to placebo.

Hou et al N Engl J Med
2006: 354: 131-140

Figure 2. Kaplan–Meier Estimates of the Percentage of Patients Not Reaching the Primary Composite End Point of a Doubling of the Serum Creatinine Level, End-Stage Renal Disease, or Death.

Group 1 had a serum creatinine level of 1.5 to 3.0 mg per deciliter, and group 2 had a serum creatinine level of 3.1 to 5.0 mg per deciliter at baseline.

ACEi cause Renal Progression?

Antihypertensive	RR	CI
ACEi	2.5	1.3-4.7
B-Blocker	0.8	0.5-1.4
CCB	0.7	0.4-1.3
Thiazide	1.0	reference

Adjusted for age, sex, CVD and CCF: 7.8 y follow-up

Is it all Blood pressure?

Or a specific ACEi effect for CVD and CKD protection?

The data from AASK and REIN-2 with a 14 mmHg and 4.8 mmHg difference in systolic BP suggest that patients with substantial reduced kidney function would not derive similar benefit to RAAS blockade on CKD progression apart from BP lowering

Beneficial effects of lowering BP for CV protection and mortality is class of drug independent

Figure 2. Kaplan-Meier Plot of Cumulative Probabilities of Acute Kidney Injury and Hyperkalemia.

Acute kidney injury was defined as acute kidney injury requiring hospitalization or occurring during a hospitalization. Hyperkalemia was defined as a potassium level that was more than 6.0 mmol per liter or that required an emergency room visit, hospitalization, or dialysis. The P values were calculated with the use of a stratified log-rank test.

Change in GFR after stopping ACEi

A >4ml improvement in GFR was predictive of survival without RRT

Fig. 2. Kaplan-Meier estimates of patients surviving without RRT. Time zero is when RAS inhibitors were stopped. Events were RRT or death. Solid line: patients with *baseline to after* eGFR increment ≥ 5 ml/min/1.73 m² ($\Delta eGFR \geq 5$); dashed line: those with eGFR increment < 5 ml/min/1.73 m² ($\Delta eGFR < 5$). log-rank test, $p = 0.03$.

Rapid rate decline on entry to LCC vs comparative slopes and Mortality ($p=0.075$)

Comparison of >4ml/min decline versus slow decline on mortality

Goncalves AR, El Nahas M et al Nephron Clinical Practice 2011: 119: 348-354

Brown O, Bhandari S Renal Association 2013 (abstract)

Clinical Equipoise in Advanced CKD?

- Studies have failed to dissociate beneficial effect of RAAS versus BP lowering (Hou data from 2006 on benazepril is conflicting)
- Cardio-protective effect
 - No evidence of reduced CV morbidity/mortality
- Anti-proteinuric effect – is it important in advanced CKD?
 - ?less relevant due to severe glomerulosclerosis
- Reduction in ESRD incidence – data lacking in advanced progressive CKD
- Causes progressive renal dysfunction
 - Increase hyperkalaemia
 - ? Sudden cardiac death
 - Increase anaemia and potentially ESA use

Retardation of CKD progression may be a strategy for CVD Protection

Kidney function is an independent risk factor for CV mortality in the general population

CKD Prognosis Consortium Lancet Matsushita et al 2010; 375: 2073–2081
Go et al 2004

Trial Purpose - Main Research Question - Hypothesis

Stopping ACEi or ARB treatment, compared with continuing on these treatments, improves or stabilises renal function in patients with progressive stages 4 or 5 CKD based on assessment of renal function using the MDRD 4-variable eGFR at 3 years follow-up (provided good blood pressure control is maintained)

TRIAL DESIGN

- An investigator led
 - multi-centre
 - open-label
 - randomized controlled
 - clinical study
 - 410 participants
 - advanced progressive CKD Stage 4/5
 - receiving ACEi and/or ARBs

2 years recruitment

CKD patients stage 4-5
ACEi/ARB treatments

Eligible for
STOP-ACEi study?

No

Excluded
Not Meeting Criteria
Declined
Other Reason

Yes

Randomise
1:1 ratio, N=410

Control Arm:
Continue ACEi/ARB
N=205

Experimental Arm:
Discontinue ACEi/ARB
N=205

3 years follow-up

3 Year Follow-Up

3-monthly visits - routine tests (eGFR, FBC, BCP, urinary PCR), BP, documentation of ESA dose, adverse events, compliance and changes in medication

Extra tests at annual visits - QOL questionnaire, weight and BMI, 6-minute walk test, ECG, and bloods for C-reactive protein, cystatin-C, NT-proBNP, ACE/renin levels and biomarkers

TARGET BP
<140/85

Eligibility

Key Inclusion Criteria

- Aged ≥ 18 years (male or female)
- CKD stage 4 or 5 (eGFR < 30 ml/min/1.73 m² using the MDRD equation) and not on dialysis therapy
- Progressive deterioration in renal function (fall in eGFR of > 2 ml/min/1.73 m²/year)
- Treatment with either an ACEi or ARB or a combination of both for > 6 months with at least 25% of the maximum recommended daily dose
- Resting blood pressure (BP) $\leq 160/90$ mmHg
- At least 3 months of specialist renal follow-up at the time of entry into the trial

Key exclusion criteria

- Aged < 18 years
- Undergoing dialysis therapy
- Uncontrolled hypertension ($> 160/90$ mmHg) or requirement for 5 or more agents to control BP
- History of myocardial infarction or stroke in preceding 3 months
- Pregnancy or breastfeeding
- Immune mediated renal disease requiring disease specific therapy

Screening and Randomisation

CKD STAGE 4 or 5

>2ml/min fall eGFR in 12months – 3 values
BP $\leq 160/90$ mmHg
ACEi/ARB >6/12

Consent

Randomisation -Minimisation Variables

One to one

- Online
- telephone

Computer generated programme at BCTU using a minimisation algorithm

Pre- specified

- Diabetes Mellitus
- Blood pressure $\text{MAP} < 100; \geq 100 (\text{diastolic} \times 2 = \text{systolic} / 3)$
- Age $< 65; \geq 65$ years
- Proteinuria $< 1\text{g}; \geq 1\text{g}$
- eGFR $< 15 \geq 15$ ml/min

Objectives - End-point

410 patients with eGFR $<30\text{ml/min}$ and $>2\text{ml/min/year}$ loss of eGFR over 1 year – 3 measures and BP $\leq 160/90$ mmHg and on ACEi/ARB for at least 3 months

ACEi/ARB

STOP- ACEi

Primary Endpoint = 5ml difference at 3 years in eGFR based on MDRD (effect size 0.31 with 80% power and $\alpha = 0.05$)
